## **Cover photo:**

Since 1956 this steam-powered mill has operated on the banks of the mill pond in Onalaska (Lewis County). It was built by Gene Frase who picked up inexpensive surplus steam equipment when most commercial saw mills were retrofitting to electric power. Gene operated the mill until a few years ago and now (in his 90s) occasionally runs it with his son Steve Frase for their own projects. The mill uses sawdust and slab wood to fuel the boiler. One boiler provides steam power for six engines. The largest engine powers the main saw, head saw, log carriage feed and the sawdust conveyer system. Other engines run a winch for pulling logs from the pond, an adjuster (for setting the width of the cut on the log carriage) and feed rollers. Photos: Jim Thode (2005).

## Introduction

This report is a census of Washington's primary wood products industry. It covers mills and log exporting operations which traditionally used raw logs. While pulp and plywood mills have modified their manufacturing processes and now use few raw logs, they are kept in the Mill Survey to maintain continuity of statistics.

Few places on earth grow timber—Douglas-fir and related species—that produce prized structural lumber so efficiently. In just 35 years Washington-grown Douglas-fir trees can reach a harvestable age with a diameter of 12 to 14 inches and a height of 70 to 80 feet (up to 120 feet on some sites). A single acre of mature trees can yield 30,000 to 40,000 board feet, enough to build two to three average-sized homes.

The U.S. is the world's largest producer of softwood products. Among states, Washington is the second largest producer (after Oregon). A total of 16.2 million acres (out of a total of 23 million forested acres) are managed as commercial forests primarily for growing softwood.

The computer software and aerospace industries are major economic drivers in Washington. But wood products still contribute more than \$5 billion to the state's Gross Domestic Product and employs about 30,000 workers. (See page 18)

Even though it has declined significantly in recent years, the log export industry is still worth about \$400 million annually, according to the state's Department of Community, Trade & Economic Development. Wood products is also a major industry in eastern Washington, contributing up to a quarter of the state's total log volume.

The agricultural side of managing forest lands (growing, logging) adds nearly \$2 billion in gross business income annually, according to the state's Department of Revenue.

Published biennially since the late 1960s, *Washington Mill Survey* covers product manufacturing and mill characteristics from data directly provided by mill managers and owners.

The report covers seven industries, including:

- Lumber
- Pulp
- Shake and Shingle
- Veneer and Plywood
- Post, Pole, and Piling
- Log Export Operations
- Log Chipping

While other agencies and wood products industry associations publish general summaries, the Mill Survey provides details and statistics not available elsewhere. The tables include data on log volumes, mill capacities, log species, days of operation, and the use of wood residues. It is a resource for a broad audience of industry managers, economists, public officials and state residents.

Most log measurements are in thousand board feet Scribner rule— an early 20th century scale that estimates a log's lumber volume. Due to mill efficiencies in recent decades, the lumber output (measured in "lumber tally") usually exceeds log input (in Scribner).

Since this survey covers the entire industry, sampling errors are not a factor. However, some data was calculated based on data from previous years. Also some tables and categories (industries, counties or economic areas) were combined into an "Other" category to avoid disclosure of an individual company's data.

## The economic areas used in this report

Throughout the Mill Survey these economic areas are used to indicate the locations of mill operations and forests where timber is harvested. An economic area is an area where economic activity in the forest products industry is similar. The economic area boundaries are not all drawn according to natural geographic features.

---

### Abbreviations and Conversions

#### Log volume (Scribner scale)

board foot	=	12-inches x 12-inches x 1-inch
mbf	=	1,000 board feet
mmbf	=	1 million board feet
Bbf	=	1 billion board feet

#### Lumber (volume)

1 mbf lumber tally = 1,000 board feet

#### Plywood and Veneer

msf 3/8-inch basis = 1,000 square feet 3/8-inch thick  
 mmsf 3/8-inch basis = 1 million square feet 3/8-inch thick

#### Pulp (weight)

ton = 2,000 pounds  
 bone dry tons (BDT) = 2,200 pounds (10% water)  
 mbf of logs = 7.5 tons of pulp

#### Shake and Shingle (area)

square = 100 square feet  
 1 cord = 5 squares or 1/2 mbf  
 mbf = 10 squares

# Mill Survey Analysis

## 1996-2006

The analyses in this chapter provide multiple-year views of trends in the seven forest product industries in Washington.

Graph 15	<b>Chipping mills</b> .....	17
	<b>Value estimates for Washington's 2006 primary wood products</b> .....	18

**Graph 1 Production**

Graph 1a through 1f below display total production by industry. Lumber output from sawmills increased (1a) fairly consistently over the years. Post, pole and piling production (1e) has a high degree of variability between years. The other industries experienced a slow (veneer and plywood) and sometimes (shake and shingle, log exports) a sharp decline in output.

**Sawmill**  
Graph 1a

Graph 1d  
(million squares)

**Post, Pole, and Piling**  
Graph 1e  
(mmbf)

**Log Exports**  
Graph 1f  
(mmbf)

**Graph 2 Number of operations**

Graph 2 shows the total number of operations in the forest products industry in Washington, by industry (mills and log export businesses). The number of operations peaked in 2000, with a total of 228. Since then, all industries have seen decreases, with the greatest decreases (over 50 percent each since 1996) in the log export, shake and shingle, and pulp industries. Sawmill is the only industry in 2006 that actually saw an increase over 2004, with the addition of four new mills.

### Graph 3 Log consumption

Total log consumption by Washington mills declined 16 percent in the 1996-2006 period. Mills consumed 4.4 billion board feet (bbf) in 1996 and 3.7 bbf in 2006

#### Log Consumption by Industry

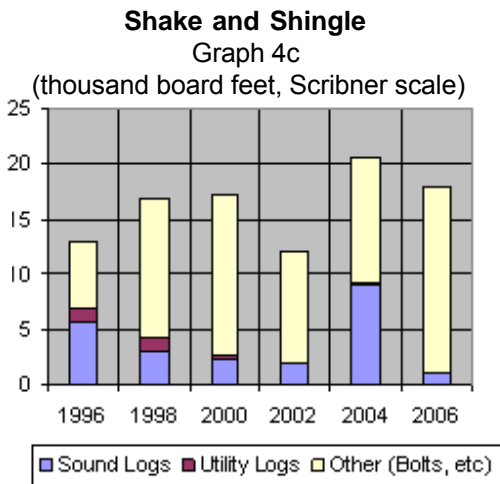

Graph 3  
(billion board feet)

Graph 4 Log consumption by industry

4a through 4f display log consumption by log size, except 4c (shake and shingle) which displays log consumption by type. In the shake and shingle industry nearly all of the material is delivered to mills as bolts (chopped up timber), or the remains of salvaging operations.

Note: Diameter data not available for 1996

**Graph 5 Tree species**

Douglas-fir was the dominant single species throughout the 10-year period, comprising about half of the consumed volume (Graph 5a). In general, each species or group has fairly consistent consumption levels over this period, with the exception of “other conifers.” This is due to the increased consumption of white firs in 2004, which doubled. Graphs 5b and 5c show that the species consumption mix between 1996 and 2006 did not change much. There was a 7 percent drop in the Douglas-fir. Eastern Washington Lodgepole and Ponderosa pines increased their species share.

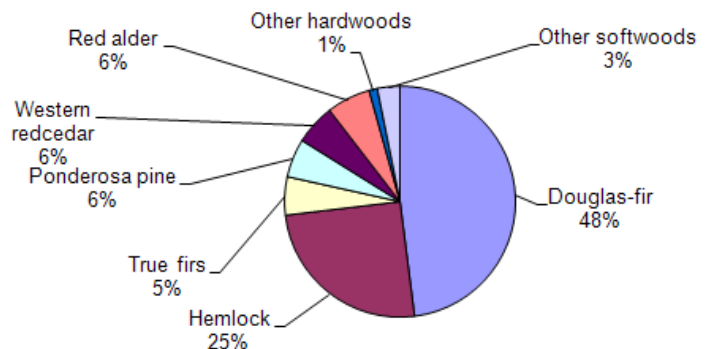

**Log Consumption by Species**  
 Graph 5a  
 (million board feet, Scribner scale)

**Log Consumption by Species - 1996**  
 Graph 5b

**Log Consumption by Species - 2006**  
 Graph 5c

Graph 6 Log sources

Log source by ownership, in Graph 6, shows that private timberland (Forest Industry and Small Private Landowners) continues to provide the bulk of the logs to the forest products industry. Among public timberland owners, the Department of Natural Resources (state) supplies the largest share about 12 percent of logs to the forest products industry.

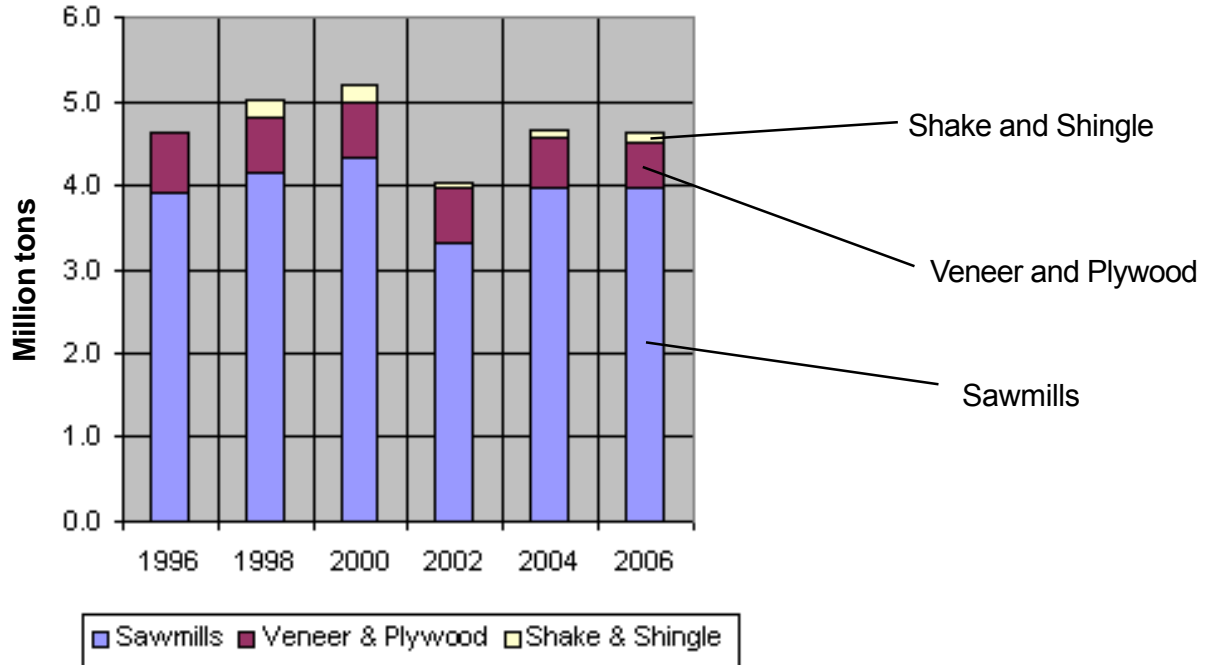

Graph 7 Wood residues

Graphs 7a and 7b display the production and use of wood residues by industry. Not surprisingly, sawmills are the largest producer of residues. Residues are predominately used for pulp, although between 1996 and 2006 they were increasingly used for fuel.

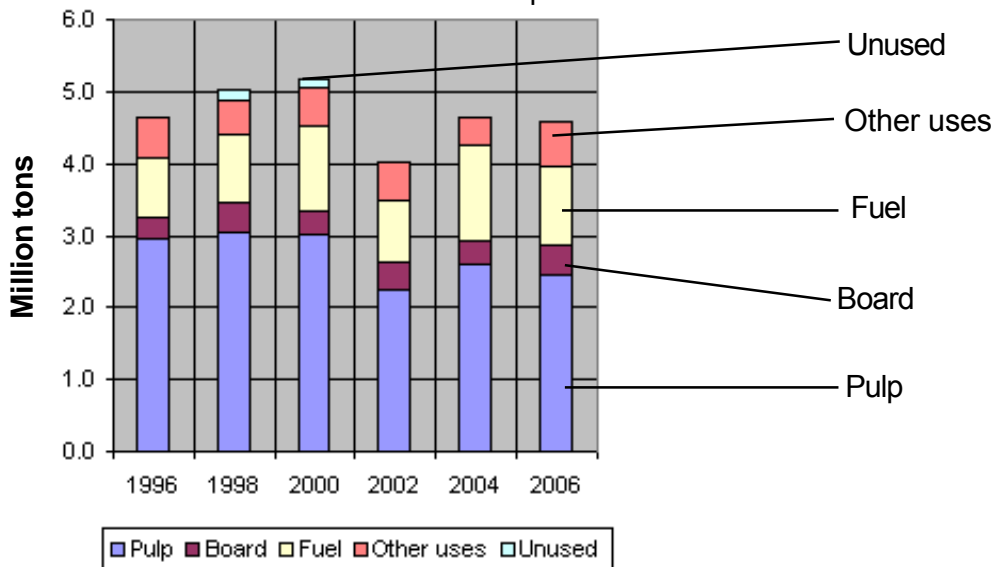

Production of Wood Residue (not bark)

Graph 7a

Use of Wood Residues (not bark)

Graph 7b

**Graph 8 Productivity**

Productivity (production divided by consumption volumes) is displayed by industry in Graph 8. All industries remained at closely similar levels throughout the 10-year period, except shake and shingle mills and sawmills. Sawmills increased productivity by 10 percent between 2004 and 2006, while shake and shingle mills saw some of their lowest productivity over the 10-year period.

**Productivity**  
 Graph 8  
 (higher numbers indicate increased efficiency)

**Graph 9 Sawmills**

The sawmills' story over the 10-year period ending in 2006 is presented in these graphs. Total lumber production (9a) rose 40 percent from 3.55 billion to 4.55 billion board feet while average per mill production rose 56 percent. However, the total (9c) and average per mill (9d) log consumption rose only slightly. These contrasting statistics underscore the fact that sawmills overall rapidly improved productivity (9e) by a third in this period. Several small mills closed down and were replaced by fewer larger and more efficient operations.

**Avg Log Consumption per Mill**

Graph 9d  
(mbf Scribner scale)

**Productivity of Sawmills**

Graph 9e  
(input/output ratio)

**Number of Sawmills**

Graph 9f

**Graph 10 Veneer and plywood mills**

Up until the last decade, two-step plywood manufacturing was carried out primarily by integrated mill operations, which produced plywood and the veneer to make the plywood. But since 1998 the number of integrated mills has dropped from nine to five while mills that specialize in veneer or plywood have remained (10a) . On this page (10a - 10e) and the next page (10f - 10k) the move to specialization is revealed. In nearly every graph the bars representing integrated veneer-plywood mills shortened while the bars representing veneer-only or plywood-only mills lengthened or remained the same. This trend indicates the efforts of plywood mills to improve efficiencies and survive the competition with other “engineered” wood products (particle board, oriented strand board, etc.).

(thousand square feet, 3/8" basis)

Veneer mill graphs on next page »

**Veneer and plywood mills continued**

Graph 11 Pulp mills

The past ten years have seen major changes in pulp mill operations. The number of mills dropped by more than half (11f). The heavy investment of the last two decades to meet environmental requirements did not always contribute to production efficiencies. However, the remaining operations grossed at least \$4 billion a year, according to the Washington Department of Revenue. Bleached (copy) and unbleached (corrugated) paper increased in volume (11a, 11b) while production of newsprint and “other” paper dropped. Chips (from mill residues and chipping mills) are the main raw material (11c, 11d). The volume of recycled paper (11e) has nearly tripled and now makes up to 16 percent of the raw material.

**Total Production Volume**

Graph 11a  
(bone dry tons)

(mbf, Scribner scale)  
logs and bolts

**Productivity (efficiency)**

Graph 12e  
Input output ratio

**Number of Mills**

Graph 12f

**Graph 13 Log export operations**

Washington’s log exports industry continued to decline over the last 10 years but a few operations are holding on. In 1980 more than 130 log export operations shipped 2.3 billion board feet. By 2006, only 11 operations exported 541 million board feet. In the 1998-2006 period the number of operations (13c) decreased from more than 40 down to 11. The total volume (13a) dropped by a third which means the operations still in business saw their average volumes (13b) more than double.

**Total Volume Logs Exported**

Graph 13a  
(mbf, Scribner scale)

**Avg Log Volume Exported**

Graph 13b  
(mbf, Scribner scale)

**Number of Operations**

Graph 13c

**Graph 14 Post, pole, and piling mills**

Poles, posts, and pilings are special forest products with unique characteristics that make them more valuable than saw logs. Good telephone and utility poles are tall but with narrow growth rings and minimal taper. Logs for poles are also worth more than four times what they would be worth for lumber. There were about a half dozen pole mills in 2006 (14f). Over the most recent 10-year period, total production (14a) declined but not as fast as the number of mills (14f). So, the remaining mills saw their average production per mill (14b) rise to make up the difference. For the same reason, total log consumption did not vary much while average log consumption more than doubled (between 1998 and 2006). Since the milling process is minimal for post, poles, and pilings, the productivity (14e) does not vary much.

**Total Production**

Graph 14a  
(mbf, Scribner scale)

**Avg Production per Mill**

(mbf, Scribner scale)

**Avg Log Consumption per Mill**

Graph 14d  
(mbf, Scribner scale)

**Productivity**

Graph 14e

**Number of Mills**

Graph 14f

**Graph 15 Chipping mills**

Chip mills grind logs into chips which are most often sold to pulp mills. Chip mills provide pulp operations 16 percent of raw material with most of the remaining coming from sawmill residues. Sawmills historically have been the main source of chips for pulp mills. But as sawmills slowed and became more efficient (reducing the volume of mill residues), pulp mills are becoming more dependent upon chip mills. Log chipping is the only industry in the primary wood products industry that did not decline by any measure between 2002 and 2006. Just before that period, the number of mills dropped to historic lows (15e) At the same time average and total production (15a, 15b) and log consumption (15c, 15d) rose.

**Value estimates for Washington’s 2006 primary wood products**

Although the Mill Survey focuses on volumes, this table is included to provide an estimate of the total value of Washington’s wood products. The price per unit estimates were provided by industry organizations and mill managers who also contributed data for the Mill Survey. In total all wood products industries produced nearly \$5.5 billion in gross output.

<b>Product</b>	<b>Units</b>	<b>Price/unit</b>	
<b>Export logs (mbf)</b>	541,038	\$730	\$ 395,000,000
<b>Plywood (m sq. ft.)</b>	688,303	\$350	\$ 241,000,000
<b>Veneer (m sq. ft.)</b>	559,046	\$180	\$ 101,000,000
<b>Shake Mills</b>			
Shakes (squares)	3,306	\$156	\$ 1,000,000
Shingles (squares)	85,725	\$200	\$ 17,000,000
Other cedar (squares)	45,943	\$46	\$ 2,000,000
<b>Roundwood chip (bone dry tons)</b>	1,224,057	\$133	\$ 163,000,000
<b>Pulp Mills</b>			
Newsprint (metric tons)	1,072,184	\$617	\$ 662,000,000
Bleached paper (tons)	910,116	\$900	\$ 819,000,000

Table 1 shows the number of operations (listed by category in each column) and which counties (listed vertically in the far left column) where they operated in 2006. For instance, in Lewis County there were 14 mills—8 Sawmills, 1 Plywood mill, 1 Shake and shingle mill, 2 Post, Pole & piling mills and 2 Chipping mills.

Table 2 shows the total volume of logs and plant residues that were used by all wood products mills in each economic area and industry. For instance, roundwood chipping operations in the Olympic Peninsula economic area used a total of 161,789 mbf (thousand board feet, Scribner scale) logs. The "Other" category for type of wood, includes cants (large planks or timbers cut for further sawing elsewhere) and bolts/blocks (sections of cedar logs which will be further processed to make cedar shake, shingle, and hip-and-ridge products).

Table 3 shows the total volume of logs used by each wood products industry and the states where they were harvested. For instance, 42,022 mbf (thousand board feet, Scribner scale) of logs from British Columbia were exported to overseas markets through ports in the Olympic Peninsula Economic area.

Table 4 (on five pages) shows the volume of logs harvested from each county (listed in columns) for use by wood products operations in each county (listed by row in the far left column). This table shows the extent in distance that mills could economically receive logs. Usually mills prefer to purchase logs from the closest forests to reduce transportation costs. However, this is not always the case. For instance, (on Page 24) the table shows that mills in Stevens County used 4,299 mbf (thousand board feet, Scribner rule) of logs from Grays Harbor County.

**Table 4a Log consumption—by county of operation and harvest**

\* "Others" indicates counties were combined to avoid disclosure of individual corporate data.

Table 4f shows the volume of logs harvested from other states and processed in Washington mills or exported through a Washington port. For instance, the top volume of out-of-state logs were sent from Oregon to Cowlitz County (214,936 mbf, see page 89). Nearly all of those logs (212,875 mbf) were exported through the Port of Longview. (See Page 89.)

Table 5 offers two views of logs harvested from national forests. It shows the volume of logs mbf (thousand board feet, Scribner scale) that were harvested from each national forest and sent to mills in each economic area. For instance, wood products operations in the Puget Sound Economic area used nearly 15 mmbf (million board feet, Scribner scale) of logs from Olympic (2,718 mbf), Mount Baker-Snoqualmie (12,143 mbf), Wenatchee (43 mbf) and Okanogan (43 mbf) national forests. Federal law prohibits the sale of logs from public forests for export to foreign markets.

**Table 5-1 Logs harvested from National Forests**

\* "Others" indicates industries were combined to avoid disclosure of individual corporate data.

Table 7 (on three pages) shows the number of operations (mills and log exporters) and their percentage of log volume by economic area where harvested. The criteria are similar to Table 6, except the numbers are sorted by type of industry (log export, lumber, etc.) For instance, 102 of 137 mills statewide did not purchase logs from National Forests.

\* "Others" indicates industries were combined to avoid disclosure of individual corporate data.

Table 10 shows the total volume of wood and bark residues that were produced in the Lumber, Veneer & Plywood & Shake and shingle industries. Pulp, Log Export and Post, Pole & piling industries do not produce marketable volumes of residues (secondary leftover material). In the chipping industry chips are the end product, not a "residue." The table also shows the volumes of residues used for each purpose. **Board:** Oriented strand board (sheathing panels), particle board. **Pulp:** paper products. **Fuel:** mill site boilers for the manufacturing process (pulp mills) or drying wood products. **Other:** garden mulch, barn shavings. For instance, the mills in the Olympic Peninsula Economic Area produced more than 2.6 million dry tons of wood residues in 2006 and sold more than 1 million tons to pulp mills.

**Table 10-1 Wood and bark residues—production and use**  
(tons, dry weight)

\* This table uses 6 mill class sizes. All other tables use 4 mill class sizes. Mill size classes indicate the capacity to process logs (in thousand board feet, Scribner scale) during an 8-hour shift.

**Class AAA:** More than 500 mbf  
**Class AA:** 250-500 mbf  
**Class A:** 120-250 mbf  
**Class B:** 80-120 mbf  
**Class C:** 40-80 mbf  
**Class D:** less than 40 mbf

Table 14 shows the total 8-hour capacity (in lumber tally) of sawmills sorted by county and economic area. For example, the total 8-hour capacity of all 68 sawmills in Washington is 13.5 million board feet, enough lumber to build more than 300 homes.

**Table 14 Sawmills' capacity—by 8-hour single shift and mill size\***

\* Mill size classes indicate the capacity to process logs (in thousand board feet, Scribner scale) during an 8-hour shift.

**Class A:** More than 120 mbf

**Class B:** 80-120 mbf

**Class C:** 40-80 mbf

**Class D:** less than 40 mbf

Table 18 lists the average operating days, single shift capacity, average log consumption and average lumber production by mill size and economic area. For instance, the average log consumption per economic area around the state was between 24,193 mbf and 45,923 mbf consumption. The state's overall average was about 27 million board feet.

**Class D:** less than 40 mbf

Table 19 shows the total volume of logs that were processed by sawmills, according to mill size. The two right-most columns show totals of other forms of wood such as peeler cores (remnants of veneer manufacturing) or precut lumber. For instance, the largest volume of logs were consumed by sawmills in the Olympic Peninsula economic area, more than 888,576 mbf or about 37 percent of the state's total.

Tables 21a-21b show the total volume of logs that were processed by sawmills, according to mill sizes and ownership categories. For instance, even though the largest category of mills (A) consumed about 90 percent of the state's total volume of logs, only 48 million board feet (about two percent) came from national forests.

Tables 24a-24b show the total volume of logs that were processed by sawmills, according to mill size\*, economic area and species. This chart can indicate which species are more plentiful in the dry east side or the wet westside of the state. For instance, the mills in the Central Washington economic area consumed 61,516 mbf of Douglas-fir and hemlock trees (the two top lumber species statewide) but 89,240 mbf Ponderosa and Lodgepole pines (which are better suited for dry climates).

Tables 25a-25b show the total volume of logs that were consumed in Washington, according to the mills' home county, economic area and tree species. (Tables 24a and 24b grouped the data by mill size.) For instance, mills in Yakima County processed more timber than any other county in eastern Washington; and the predominant tree species was Ponderosa pine.

Tables 27a-27d show the volumes of mill residues (chips, sawdust, etc.) that were used or sold for secondary purposes (such as pulp, composite boards and fuel), according to type of residue (not bark) and mill size\*. The "Total" category includes residues that were used and unused. For instance, from the 1,024,586 total bone dry tons of fine residues (see Page 69) produced as a by-product of lumber mills, 228,583 tons were sold to pulp mills —22.3 percent.

Table 29 is an accompanying view of the data in Table 28. Instead of displaying the totals according to mill size\*, it shows the volume of bark residues by the sawmills' home counties and economic areas. For instance, the sawmills in the Olympic Peninsula economic area produced 40 percent of the state's bark residues (505,179 tons of 1,277,611 total tons) as a by-product of processing lumber.

**Table 29 Bark residues from sawmills—by county\* and use**

## Veneer and Plywood

Table 32	<b>Number of veneer and plywood mills—by lathe log diameter</b> .....	76
Table 33	<b>Number of veneer and plywood mills—by minimum core size</b> .....	76
Table 34	<b>Veneer and plywood mills—by 8-Hour single shift production capacity</b> .....	76
Table 35	<b>Logs consumed by veneer and plywood mills—by diameter</b> .....	77
Table 36	<b>Veneer and plywood production</b> .....	77
Table 37	<b>Number of veneer and plywood mills—by selected equipment</b> .....	77
Table 38	<b>Wood residues from veneer and plywood mills</b> .....	78
Table 39	<b>Average number of operating days—veneer and plywood mills</b> .....	78

Table 32 displays the number of veneer and plywood mills by maximum lathe diameter . (A lathe peels veneer from a log by spinning it on its axis against a blade.) For instance, only one veneer mill can handle logs larger than 80 inches in diameter . All other veneer mills are limited to logs 39 inches or narrower .

**Table 32 Number of veneer and plywood mills—by lathe log diameter**

Economic area	Layup only	Lathe log maximum diameter limit in inches								Total

<b>State Total</b>	<b>1,060</b>	<b>829</b>	<b>676</b>	<b>860</b>

\*Others indicates that two or more economic areas have been combined to avoid disclosure of individual corporate data.

Table 35 displays the volume of logs processed to make veneer (from veneer-only and plywood-and-veneer mills) by log diameter. For instance, no logs less than 5 inches in diameter were used. But 61 percent (142,641 mbf) of the veneer was made from logs between 5 and 11 inches in diameter.

**Table 35 Logs consumed by veneer and plywood mills—by diameter**  
(thousand board feet, Scribner scale)

Minimum log diameter	Volume	Percent
Less than 5 inches	0	0%
5.0 to 10.9 inches	142,641	61%
11.0 to 20.9 inches	76,579	33%
21 inches or more	14,749	6%
<b>State total</b>	<b>233,969</b>	<b>100%</b>

Table 36 displays the volume of veneer-only and plywood-only and veneer-plywood mills, based on thousand square feet, 3/8-inch basis. For instance, the plywood mills in Washington produced 688.3 million square feet of plywood.

**Table 36 Veneer and plywood production**  
(thousand square feet, 3/8-inch basis)

Veneer	559,046
Plywood	688,303

Table 37 displays the number of veneer and plywood mills which possess a variety of related equipment. For instance, seven plywood mills operate with a hot press, which simultaneously heats and presses together three or more layers of veneer. The heated glue is better distributed and bonded to the layers of veneer.

**Table 37 Number of veneer and plywood mills—by selected equipment**

Table 40 shows the number of pulp mills based on their method of production. Methods include chemical (sulphate [or “kraft”] and sulphite), groundwood (mechanical grinding) and semi-chemical (both chemical and mechanical “chemi-thermomechanical”). For instance, five out of 12 mills use mechanical grinding as part of the production process—3 groundwood and 2 semi-chemical.

**Table 40 Number of pulp mills—by processing type**

## Shake and Shingle

Table 47	<b>Shake and shingle mills' capacity and operating days</b> .....	84
Table 48	<b>Shake and shingle mills with selected equipment</b> .....	84
Table 49	<b>Log consumption by shake and shingle mills—by type</b> .....	84
Table 50	<b>Shake and shingle mills' production</b> .....	84
Table 51	<b>Log consumption by shake and shingle mills—by original owners</b> .....	85
Table 52	<b>Log consumption by shake and shingle mills—by diameter (in inches)</b> .....	85
Table 53	<b>Wood and bark residues—produced by shake and shingle mills</b> .....	85
Table 54	<b>Use of residues—by use and type</b> .....	86

Table 47 shows the average number of operating days, mill capacities and product volumes of shake and shingle mills. For instance, Washington's 16 shake and shingle mills operated an average of 207 days in 2006.

**Table 47 Shake and shingle mills' capacity and operating days**

Economic area	Total mills	Single Shift Capacity (Squares)			Avg number of operating days / year
		Shake	Shingle	Other	
Olympic Peninsula	13	151	479	20	212
Puget Sound and Lower Columbia	3	70	119	200	185
<b>State total</b>	<b>16</b>	<b>221</b>	<b>598</b>	<b>220</b>	<b>207</b>

**Table 48 Shake and shingle mills with selected equipment**

Economic area	Chipper	Barker	Burner	None
Olympic Peninsula	0	0	0	3
Puget Sound and Lower Columbia	0	0	0	13
<b>State Total</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>16</b>

Table 48 shows the number of mills that used extra equipment for shake and shingle manufacturing. None of the shake and shingle mills in Washington possessed a chipper, barker or burner.

**Table 49 Log consumption by shake and shingle mills—by type**  
(thousand board feet, Scribner scale)

Economic area	All types	Sound logs	Utility logs	Others *
Olympic Peninsula	7,014	300	45	6,669
Puget Sound and Lower Columbia	10,925	400	0	10,525
<b>State total</b>	<b>17,939</b>	<b>700</b>	<b>45</b>	<b>17,194</b>

\* "Others" includes blocks, bolts, lumber, etc.

Table 49 shows the volume of logs and other forms of wood received by the shake and shingle industry. For instance, the mills received mostly blocks, bolts or lumber (17,194 mbf) and relatively few logs (745 mbf).

**Table 50 Shake and shingle mills' production**  
(squares)

Economic area and county of operation	Total	Product		
		Shakes	Shingles	Other
Olympic Peninsula	66,234	2,616	58,675	4,943
Puget Sound and Lower Columbia	78,740	690	27,050	41,000
<b>State total</b>	<b>134,974</b>	<b>3,306</b>	<b>85,725</b>	<b>45,943</b>

Table 50 shows the volume of products (in squares) from shake and shingle mills. For instance, shingles made up 64 percent (85,725 squares out of 134,974 squares total) of the total production of shake and shingle mills.

Table 51 shows the volume of logs used by shake and shingle mills by log source category . For instance, all of the logs consumed by shake and shingle mills in the Puget Sound and Lower Columbia economic areas came from tribal lands.

**Table 51 Log consumption by shake and shingle mills—by original owners**  
(thousand board feet, Scribner scale)

Economic area	All owners	— Forest industry —							
		State	National Forest	Bureau of Land Management	Other public	Own wood supply	Other wood supply	Native American	Farmer and miscellaneous private

**Graph 24** Origin of logs exported through Washington's ports

Table 58 shows the volume and ownership categories of logs exported from each port in Washington. (Federal law prohibits exporting logs harvested from public lands.) For instance, the greatest volume of logs exported were from large industrial forests (464,395 mbf). Industrial forest owners (usually corporations) cut and exported 296,760 mbf and contractors removed an additional 167,635 mbf from industrial forests.

**Table 58 Export logs—by port and original owners**  
(thousand board feet, Scribner scale)

Port	Total	Forest industry		Native American	Farmer and miscellaneous private
		Own wood supply	Other wood supply		
Aberdeen	78,203	58,652	10,948	782	7,820

<b>State total</b>	<b>541,038</b>	<b>517,056</b>	<b>12,463</b>	<b>7,400</b>	<b>4,119</b>

**Graph 25 Original owners of exported logs**

## Post, Pole, and Piling

Table 60	<b>Number of post, pole and piling mills—by operating days and capacity</b> .....	92
Table 61	<b>Number of post, pole, and piling mills—by selected equipment</b> .....	92
Table 62	<b>Log consumption by post, pole, and piling mills—by diameter</b> .....	92
Table 63	<b>Post, pole, and piling mills' production—by treatment</b> .....	93
Graph 26	<b>Post, pole, and piling logs by diameter</b> .....	93

Table 60 shows the capacity by volume of logs that post, pole, and piling mills can peel and/or treat annually. The table also shows the average number of days post, pole, and piling mills operated in 2006. For instance, half of the state's post, pole, and piling mills (3 out of 6) are located in the Olympic Peninsula economic area.

**Table 60 Number of post, pole, and piling mills—by operating days and capacity**

Economic area of operation	Number	Annual capacity (thousand board feet, Scribner scale)		Avg number of operating days in 2006	
		Peeling	Treatment	Peeling	Treatment
Olympic Peninsula	3	265	0	250	0
Puget Sound and Inland Empire	3	12	523	140	338
<b>State total</b>	<b>6</b>	<b>277</b>	<b>523</b>	<b>197</b>	<b>338</b>

Table 61 shows the numbers of post, pole, and piling operations with peelers and burners. For instance, there are four post, pole, and piling operations with peeler equipment.

**Table 61 Number of post, pole, and piling mills—by selected equipment**

Economic area and county of operation	Total	Peeler	Burner
Olympic Peninsula	3	3	0
Puget Sound and Inland Empire	3	1	0
<b>State total</b>	<b>6</b>	<b>4</b>	<b>0</b>

Table 62 shows the volume of logs by diameter in inches that were processed by post, pole, and piling mills. For instance, 73 percent (21,735 mbf) of the logs processed by post, pole, and piling operations were 5 to 11 inches in diameter.

**Table 62 Log consumption by post, pole, and piling mills—by diameter**  
(thousand board feet, Scribner scale)

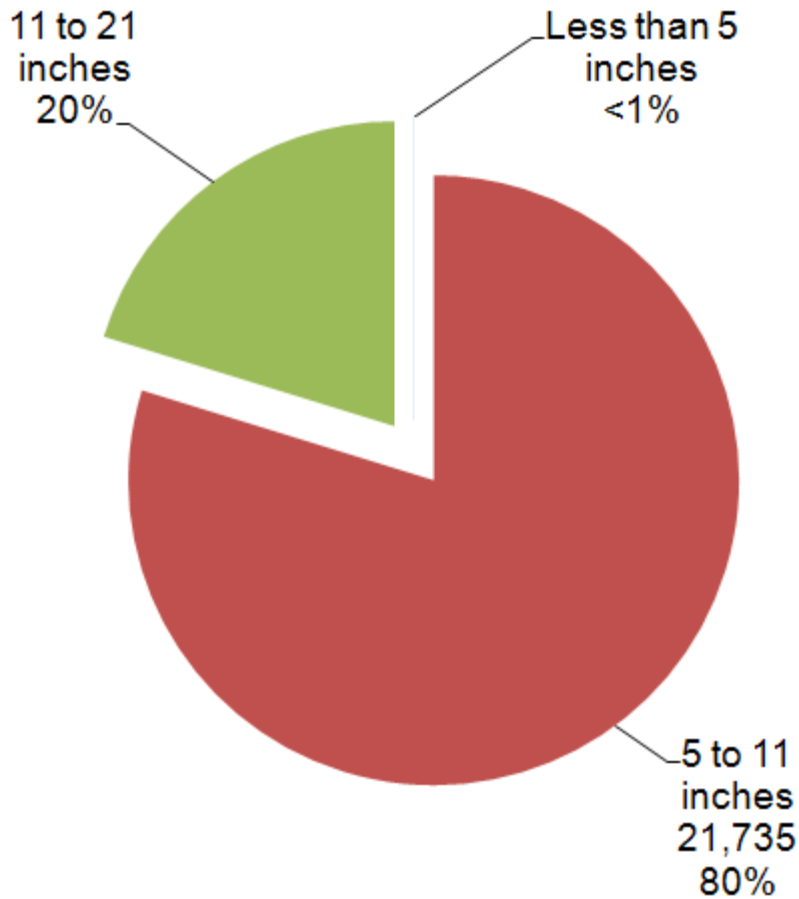

Economic area of operation	Total	Diameter in inches			
		Less than 5	5 to 11	11 to 21	21 or more
Olympic Peninsula	16,450	0	13,455	2,995	0
Puget Sound and Inland Empire	10,803	3	8,280	2,520	0
<b>State Total</b>	<b>27,253</b>	<b>3</b>	<b>21,735</b>	<b>5,515</b>	<b>0</b>

Table 63 shows the total volume of logs that were processed with and without treatment. For instance, the ratio of treated to untreated logs was about two to one (19,415 mbf to 9,949 mbf).

**Table 63 Post, pole, and piling mills' production—by treatment**  
(thousand board feet, Scribner scale)

Economic area and county of operation	Total	Treated	Untreated
Olympic Peninsula	19,415	0	19,415
Puget Sound and Inland Empire	9,949	9,949	0
<b>State total</b>	<b>29,364</b>	<b>9,949</b>	<b>19,415</b>

**Graph 26** Post, pole, and piling logs by diameter

Bill Latunen manages the PLS PoleYards which covers 27 acres in Rochester. The business can handle 4,000 to 5,000 lineal feet per day. Some poles can last 70-75 years (Douglas-fir) to 100 years (western redcedar) as utility poles. However, Latunen says there is an extra premium cost for removing and transporting logs sold as poles. "We have to use special logging practices," he said. "You can't be in a big hurry."

## Log Chipping

Table 64	<b>Number of chipping operations—by capacity and operating days</b> .....	96
Table 65	<b>Log consumption by log chipping mills—by diameter in inches</b> .....	96
Table 66	<b>Log consumption by log chipping mills—by original owners</b> .....	96
Table 67	<b>Log consumption by log chipping mills—by species</b> .....	97
Table 68	<b>Chip production—by economic area</b> .....	97
Graph 26	<b>Tree species consumed by chipping mills</b> .....	97
Graph 27	<b>Chipping log diameters (in inches)</b> .....	97

Table 64 shows the total number of chipping operations, 8-hour capacity and average days operated in 2006. For instance, the average number of working days in the Olympic Peninsula was 209.

**Table 64 Number of chipping operations—by capacity and operating days**

Economic area	Number	8-hour capacity (bone dry tons)	Avg days operated
Olympic Peninsula	7	2,760	209
Others *	6	1,865	259
<b>State Total</b>	<b>13</b>	<b>4,625</b>	<b>232</b>

Table 65 shows the volume of logs used by chipping mills by diameter in inches. For instance, a total of 99,263 mbf of logs (about 35%) were less than 5 inches in diameter.

**Table 65 Log consumption by log chipping mills—by diameter in inches**  
(thousand board feet, Scribner)

Economic area	Total	Diameter in inches			
		Less than 5	5 to 11	11 to 21	21 or more
Olympic Peninsula	161,789	57,689	38,276	42,379	23,445
Others *	124,772	41,574	19,803	41,825	21,571
<b>State total</b>	<b>286,561</b>	<b>99,263</b>	<b>58,079</b>	<b>84,203</b>	<b>45,016</b>

Table 66 shows the volume of logs consumed by chipping mills by the logs' original owners. For instance, the state's chipping mills received the largest share of their logs from privately owned industrial forests. Sixteen million board feet came from the owners of industrial forests and 179 million board feet came from contractors who removed logs from private industrial forests.

**Table 66 Log consumption by log chipping mills—by original owners**  
(thousand board feet, Scribner scale)

Economic area of operation	All owners	State	National Forest	Bureau of Land Mgt	Other public	Forest industry		Native American	Farmer and misc. private
						Own wood supply	Other wood supply		
Olympic Peninsula	161,789	19,253	10,587	0	0	0	107,637	7,933	16,379
