

Storm damage to RMZs is variable...

Reminder

Landowners can harvest using current forest practice rules (uplands)

Use salvage rules if they don't want to harvest any remaining green trees

Propose an alternate plan where they would like to deviate from rules &/or consider restoration

Existing Salvage Rules

- Salvage rules consider riparian function
- Blowdown anticipated, possibly not to this extent
- Salvage means harvest of dead or dying material

Existing Salvage Rules

- No salvage w/in bankfull width, CMZs, core zones, sensitive sites, or Np RMZs
- Inner Zone:
 - No salvage if can't meet stand requirements
 - Must retain 194 logs/acre of various, specified diameters
- Outer Zone:
 - Must retain 20 trees/acre (standing or down)

3 Kinds of Alternate Plans

Deviate from rules for an operationally difficult place

Propose short vs. long term trade-offs (ie: hardwood conversion)

Propose restoration strategy (kick start recovery of riparian zone)

Alternate Plan Evaluation

- Approval Standard
 - Provide protection to public resources >= in overall effectiveness as rules
- Functional Assessment
 - Existing conditions
 - Post-salvage conditions
 - Time to reach DFC
 - Short-term vs. long-term effects (+ and -)

Alternate Plan Evaluation

- Biggest Concerns
 - Sediment delivery; don't want to add more
 - Equipment
 - Salvage operations
 - Shade
 - Down trees
 - Residual standing trees
 - Safety
 - Safety first; may affect Rx's
 - Regeneration success

Alternate Plan Evaluation

- Field staff coordination
 - Recent training on Board Manual 21
 - DOE-WDFW discussions (how to make it work technically)
 - Increase consistency in evaluation

- Staffing assistance
 - Existing staff
 - Assistance from outside area
