ACKNOWLEDGMENT

We thank the major Forest Industrial Associations for their support of this study, and the individual mill owners and operators who provided data for this report.

We also appreciate the assistance of:

PACIFIC NORTHWEST FOREST AND RANGE EXPERIMENT STATION, U.S. DEPARTMENT OF AGRICULTURE

Donald R. Gedney, Principal Resource Analyst, for technical advice on mail questionnaires, tabular preparation, and log flow compilation.

WASHINGTON STATE DEPARTMENT OF NATURAL RESOURCES

Gerald J. Thiede, Economist, for technical assistance and economic data.

Allan L. Lemon, Computer Systems Analyst, for computerized programs for processing the survey information.

Inquiries concerning information in this report should be directed to:

John A. Bergvall, Forest Analyst

Commissioner of Public Lands

DON LEE FRASER
Department Supervisor

FOREWORD

This report presents comprehensive statistics on wood consumption and characteristics of all primary wood processing mills operating in Washington State during calendar year 1970. It documents the findings of the second in a series of biennial surveys regarding wood flow and raw material input to the State's wood-using industries.

These reports are intended to document data for the forest products industry, thus providing information for the forest industry, federal and state lawmakers, public resource managers, and others to whom this information may be useful.

Comparison of compatible statistics from these biennial surveys will indicate the effects of changes in the wood-using industries on other industries, employment, and community development.

The 1970 statistics were obtained from a mail survey conducted in 1971 and supplemented with information received by telephone. Contacts were based on the most recent industry lists, updated by the Department's districts.

Information about individual mills or companies is confidential; all data that could reveal individual identity have been combined with other data to avoid disclosure.

Production data were not a major objective of the survey but were obtained to provide information on wood requirements for given levels of production.

As the survey was a 100 per cent canvass, no sampling error is involved. The information collected from each mill is assumed to be the most reliable and best available. (Discrepancies in the 1968 report have been noted at the end of each industry segment.)

The text highlights the more significant statistics presented in the tables. It also provides a summary background of the timber economy in 1970, as well as some recent trend information.

CONTENTS

FIGURES

TABLES

TOTAL INDUSTRY

HIGHLIGHTS

Industry Characteristics

- 509 mills[1] total

Type of Mill	Number of Mills	Single Shift Capacity
Sawmills	185	10.6 MMBF
Veneer & Plywood	41	5.9 MMSF (⅜" basis)
Pulp & Board	31	11.5 Tons (Daily)
Log Export	55	NA
Shake & Shingle	172	13.9 M Sq.
Pole, Post & Piling	25	10.5 MMCF (yearly)

- Grays Harbor, with 79, was the leading county in number of mills.
- The 28 largest sawmills had 53% of total sawmill capacity.

Wood Consumption

- 7.1 billion board feet of roundwood logs consumed.
- 91 million board feet of peeler cores, cants, blocks, boards, butts, and miscellaneous peeled products.
- 4.7 million tons of chips, sawdust and shavings; 41% imported.
- Leading counties in roundwood use were:
  - Snohomish — 1,109,251 MBF
  - Cowlitz — 1,038,810 MBF
  - Grays Harbor — 830,933 MBF
- Roundwood use by industry:
  - Sawmills — 37%
  - Pulp & Board — 25%
  - Log Export — 24%
  - Veneer & Plywood — 10%
  - Shake & Shingle & Pole, Post, Piling — 4%
- 46% of total wood used by Pulp & Board was in the form of chips, sawdust, and shavings.
- 90% of all logs were from sound live timber.
- 38% of the roundwood volume was hemlock; 37%, Douglas fir; 8% western redcedar.
- Only 3% of all logs were imported, mostly from Oregon.
- 48% of the logs came from Company-owned timberlands; 17%, from National Forests.

Residues

- 5.3 million tons of wood and bark residues were generated by:

Type of Mill	Per Cent	Million Tons
Sawmills	78	4.1
Veneer & Plywood	19	1.0
Shake & Shingle	3	0.2

- 78% of all residue was wood; 22%, bark.
- 94% of wood residues were used and 79 % of the bark. 486,000 tons (wood and bark) were unused.
- 57% of wood residue went to Pulp & Board; 27%, for fuel; 10%, other uses; 6%, unused.
- Residue-producing industries averaged 1.52 tons of by-products per 1,000 board feet of logs consumed (1.18 tons of wood, .34 tons of bark).

[1]*For ease of presentation the term "mill" is used for all types of primary processing plants although it is recognized that some are better described by other terms such as export operations or facilities and pole and piling yards.*

AN OVERVIEW OF THE INDUSTRY

THE TIMBER ECONOMY

Washington's timber industry retained its national importance in 1970. Over 9 per cent of the nation's roundwood[2] was produced in this state. Also, 12.1 per cent of the nation's softwood lumber and 12.6 per cent of the softwood plywood were produced here. The consumption of pulpwood accounted for over 12 per cent of the national total. Washington remains one of the leading states in terms of wood products and roundwood consumption.

The timber industry became relatively more important to the State of Washington in 1970 because of severe reductions in the aerospace industry. The wood products industries employed[3] an average of 61,900 workers per month, a 6.1 per cent decrease from 1968. However, those fewer employees received a larger payroll, 581 million dollars, a 13.2 per cent increase for the two year period. The increased payroll accounted for 24.4 per cent of the total manufacturing payroll in comparison with 21 per cent in 1968. Although in 1970 aerospace still had the largest payroll among Washington's manufacturing industries, the wood products industry replaced it in number of employees.

Washington's 1970 total timber harvest (Figure 1), 6.46 billion board feet, decreased 7.7 per cent from the 1969 harvest of 7 billion board feet, the largest recorded since 1929.[4]

Log use by Washington mills is shown graphically in Figure 2. In developing the graph, final units of production were converted to log equivalents, Scribner scale. The Pole, Post, and Piling Industry is not shown due to graphic limitations, but its high-value products contribute to the total value of the wood products industry.

Lumber, plywood, and public stumpage prices declined during 1970, primarily because of the depressed housing market.

Late 1970 and early 1971 saw a substantial increase in housing starts with commensurate increases in lumber and plywood prices. However, the 1971 price increases slowed as housing starts became stabilized. These and other circumstances point to a cautiously optimistic outlook for Washington's wood products industries in 1971.

INDUSTRY CHARACTERISTICS

The ability of the forest products industry to compete in an environment of changing conditions and markets results from a variety of factors, many of which are beyond the scope of this report. They include policies of land use, forest land management by the public and private sectors, and corporate administration.

Other factors, which are discussed in this report, are the industry's ability to adapt to smaller diameter logs and to utilize a greater variety of species. Increased use of residues has benefited all segments of the industry by turning waste into products. Concern for the environment created stricter controls on the burning of waste residues, thus affecting a traditional operating policy of many firms.

Six segments of the industry are identified in this report: Sawmill, Veneer and Plywood,[5] Pulp and Board, Log Export, Shake and Shingle, and Pole, Post and Piling. Each segment is unique in its raw material requirements, operations, and products. Economic areas are illustrated in Figure 3. Comparisons within segments or

[3] *Employment and wage data reported to the Employment Security Department on quarterly tax reports by employers subject to the Washington Employment Security Act. Timber industry employment (SIC24 and 26) does not include some employment, such as longshoremen or truckers, not entirely attributable to the timber industry.*

[4] *"1970 Timber Harvest Report," State of Washington Department of Natural Resources, 105 pp. illus.*

[5] *The veneer and plywood industry discussed in this report consists essentially of mills producing softwood veneer and plywood. However, a few of these mills do use relatively small volumes of local hardwoods—largely black cottonwood. Mills producing veneer and plywood from exotic woods—tropical or hardwoods from eastern United States—were not included in the survey.*

economic areas can quickly be obtained by using Tables 1-8.

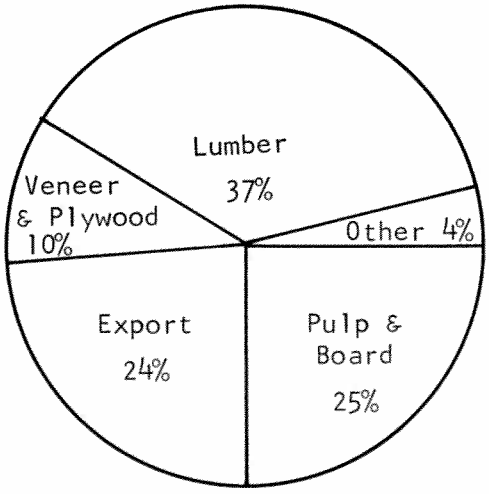
In addition to the 509 mills that operated during 1970, approximately 100 were discovered to be either out of business, not in operation during 1970, or not primary processors of raw wood material.

Production capacity per shift was little changed from 1968. However, the average number of operating days showed a significant decline, reflecting the less favorable market conditions in 1970.

WOOD CONSUMPTION

During 1970, Washington's forest products industries consumed 7 billion board feet of logs,[6] 91 million board feet of other wood, and 4½ million tons of wood residues. Sound live logs made up 90 per cent of the total roundwood, with sawmills consuming the greatest portion (38 per cent). Two per cent (total roundwood) was sound dead logs and again sawmills consumed the major portion (52 per cent). Utility or cull material, the remaining 8 per cent of roundwood, was consumed mainly by the Pulp and Board Industry (61 per cent). Figure 4 illustrates the total log consumption by industrial segment.

Figure 4.—Log Consumption by Type of Industry



[6]*In this report, Scribner log rule has been used to express board foot volume of logs. In some cases, it has been used to provide a board-foot equivalent for chips, cordwood, and other materials commonly measured in units, tons, pieces, etc.*

The 4½ million tons of wood residues consumed by the Pulp and Board Industry consisted of mill residues and material from roundwood chipping plants. This volume can be considered equivalent to 2¼ billion board feet of logs, thus allowing the total wood consumption of the forest products industry to be expressed as 9⅓ billion board feet (Scribner) for 1970.

The forest industries relied on a number of ownerships for their log supply but met over half the demand from their own lands.

Ownership		Per Cent of Log Supply
State		12
National Forest		17
Bureau of Land Management		†
Other Public		5
Total Public		34
Forest Industry	Own Wood Supply	48
	Other Wood Supply	10
Farmer & Misc. Private		8
Total Private		66
All Owners		100

† *less than 0.5*

Ownership dependency can be expressed on an individual mill basis by showing those that obtain more than two-thirds of their logs from a single ownership class.

Ownership		Number of Mills Two-Thirds Dependent
State		18
National Forest		73
Bureau of Land Management		4
Other Public		23
Total Public		118
Forest Industry	Own Wood Supply	45
	Other Wood Supply	76
Farmer & Misc. Private		78
Total Private		199
All Owners		317

Hemlock[7] was the dominant species consumed by the industry during 1970. Its 38 per cent and Douglas fir's 37 per cent accounted for three-fourths of industry's total log requirements. In Western Washington, the three major species, in order of importance, were hemlock, Douglas fir, and western redcedar. Ponderosa pine and Douglas fir were the major species in Eastern Washington.

Most segments of the industry are able to utilize a number of species; however, two segments are very limited. The Pole, Post, and Piling Industry is more than 95 per cent dependent on Douglas fir and western redcedar, and the Shake and Shingle Industry is largely dependent on western redcedar.

Washington's timberlands supplied 97 per cent of the industry's log demand. Oregon contributed 2 per cent, with most (94 per cent) of this volume being consumed in the Lower Columbia Area.[8] The remaining 1 per cent came from British Columbia, Idaho, and Montana.

RESIDUES

Production

The Sawmill, Veneer & Plywood, and Shake & Shingle segments of the industry generated all (5.3 million tons) of the wood and bark residues produced in 1970. These residues are becoming an increasingly important source of raw material for pulp and related industries.

[7]*Western hemlock and mountain hemlock have been combined under the generic designation of hemlock in this report.*

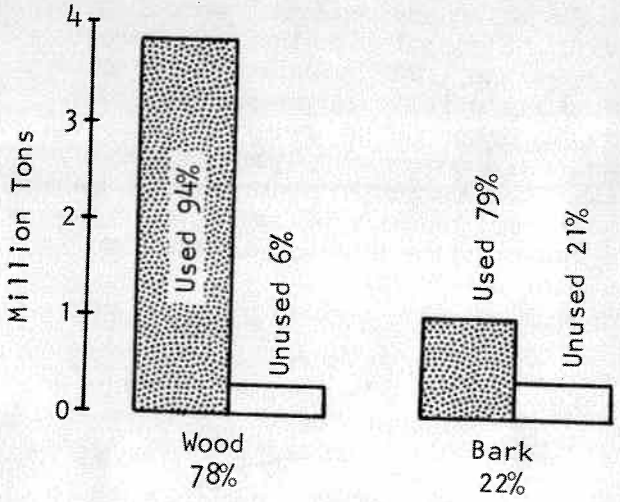
[8]*Although Klickitat County lies east of the Cascade Range, it has been included in the Lower Columbia Area and is considered as part of Western Washington for purposes of this report.*

Utilization

A significant achievement of the forest products industry has been the increased utilization of wood residues, only 6 per cent of which were unused in 1970.

Wood Residue Disposition	Per Cent
Pulp and Board	57
Fuel	27
Other uses	10
Unused	6
All Wood Residue	100

Figure 5.—Relative and Absolute Residue Volume



COMPARISON TO 1968 DATA

Numbers of operations for industry segments indicate the *net* gain or loss of *primary* wood processing facilities since 1968. Specific comparisons should be based on the actual statistics rather than the text percentages which are only valid in discussing the year on which they are based.

MILL CHARACTERISTICS

Size-class

Sawmills (185 in operation) were assigned size-classes based on maximum production for a single shift.

Mill Size-Class	Capacity per Single Shift MBF Scribner
A	120+
B	80-119
C	40-79
D	less than 40

Table 9 gives the number of sawmills per size-class in each county.

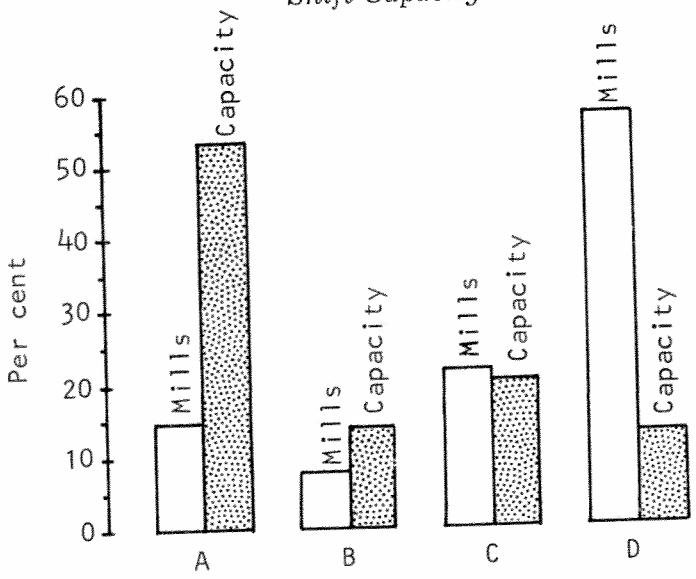
Puget Sound was the leading Area (58 mills) with Snohomish the leading county (21 mills).

Production Capacity

The general trend of the industry has been toward increased shift capacity for size-class A mills.

Year	Mills	Single Shift Capacity
1968	212	10,611,000 BF
1970	185	10,595,000 BF
Change from 1968 to 1970	Down 13%	Down 0.2%

Figure 6.—Per Cent of Sawmills by Size-Class and Per Cent of Total Shift Capacity



Equipment

Planers, chippers, or barkers were used by more than half the sawmills during 1970 (Table 12). Because of increased residue use and air pollution restrictions, less than one-third of the mills operated burners. With the exception of burners for size-class C mills and kilns for size-class B mills, sawmills in size-class A were more fully equipped than any other class of mill.

Equipment	Mill-Size-Class A	B	C	D	All
	per cent				
Planer	96	93	92	55	72
Chipper	100	93	92	23	55
Barker	96	87	89	23	53
Kiln	71	80	66	17	41
Burner	29	27	55	25	32

Information on size and type of headrig is presented in Table 13. Some mills have more than one headrig, but only the largest is represented in the table. For this reason, only 12 mills reported gang, chipping, or scragg double-cut saws as their main headrig. Generally, these types of saws handle logs less than four feet in diameter; circular and band type headrigs usually handle logs four to six feet in diameter.

Age and Ownership

Mill Size-Class	Per Cent Ownership Change Since 1950
A	18
B	53
C	39
D	17
All Mills	25

Two factors account for the small percentage of change in size-class D mills. About 10 per cent of those mills were portable, allowing their owners to take advantage of market variations and short-term timber supplies. The greatest number of marginal mills—those that can afford to operate only under the most favorable conditions—were in the size-class D group. Rather than change ownership, many just went in and out of existence.

Operating Days

The average number of operating days per year reflects the effect of market conditions on the industry. On the basis of the normal five-day work week, the annual total would be about 250 operating days. Operation in Washington's sawmills ranged from 88 days for size-class D mills in the Lower Columbia Area to 245 days for size-class B mills in the Inland Empire Area (Table 15).

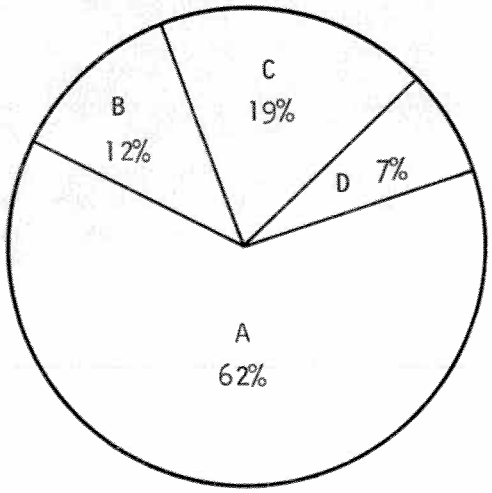
Mill Size-Class	Average Days of Operation
A	230
B	222
C	207
D	147
All Mills	178

WOOD CONSUMPTION

Raw Materials

Resaw and planing mills were not included in this survey because they are secondary manufacturers and do not consume roundwood. Of the 2.7 billion board feet consumed by sawmills during 1970, one per cent was in the form of peeler cores; the rest was roundwood in log form of which sound live logs were 92 per cent, with sound dead and utility grade logs accounting for 2 and 5 per cent respectively (Table 16).

Figure 7.—Sawmill Log Consumption by Mill-Size-Class (Table 17)



Age

Young growth timber (less than 100 years old) was a substantial part of the sawmill consumption during 1970. Tables 17 and 18 provide data on the age of timber consumed by mill-size-class and by county.

Mill Size-Class	Young Growth Per Cent
A	47
B	31
C	34
D	77
All Mills	45

The use of young growth by area shows significantly less variation.

Economic Area	Young Growth Per Cent
Puget Sound	41
Olympic Peninsula	54
Lower Columbia	38
Central Washington	47
Inland Empire	50
Total State	45

Inventories

Inventory reductions contributed eight per cent of the industry's log consumption (Table 19). Mills in the Olympic Peninsula Area obtained one-third of their consumption from inventories, although sawmills in other areas received less than three per cent.

Ownership

Sawmills relied on their own timberlands for 43 per cent of their logs (Table 20).

Ownership	Per Cent of Log Supply
State	8
National Forest	24
Bureau of Land Management	†
Other Public	7
Total Public	39
Forest Industry — Own Wood Supply	43
Forest Industry — Other Wood Supply	9
Farmer & Misc. Private	9
Total Private	61
All Owners	100

† *less than 0.5 per cent*

A breakdown of log source by mill-size-class and type of private ownership shows considerable differences.

Mill Size-Class	Forest Industry: Own Wood Supply	Forest Industry: Other Wood Supply	Other Private
	per cent		
A	61	7	4
B	19	13	10
C	14	11	12
D	7	15	45
All Mills	43	9	9

There were also area variations in ownership dependency. Public timberlands supplied the Central Washington and Inland Empire Area mills with 79 and 56 per cent of their logs respectively. National Forests contributed the greatest portion of public timber in all areas of the State. Table 22 presents the sawmills' relative dependency on various ownerships.

Mill Size-Class	Percent Mills More Than Two-Thirds Dependent on a Single Ownership
A	39
B	67
C	39
D	72
All Mills	60

Dependency information by area and size-class is necessary to evaluate the effects of timber supply policies on the industry.

Species

Douglas fir and hemlock made up 71 per cent of the logs consumed by sawmills during 1970 (Table 23). Figure 8 illustrates the species variation by economic areas.

Douglas fir was used more than any other species. Secondary in importance were: western hardwoods for class D mills, ponderosa pine for class C and B mills, and hemlock for class A mills.

Imports

Only 1.2 per cent of the total log volume was imported: Oregon imports (0.9 per cent), Idaho (0.3 per cent), and British Columbia (less than one tenth of one per cent).

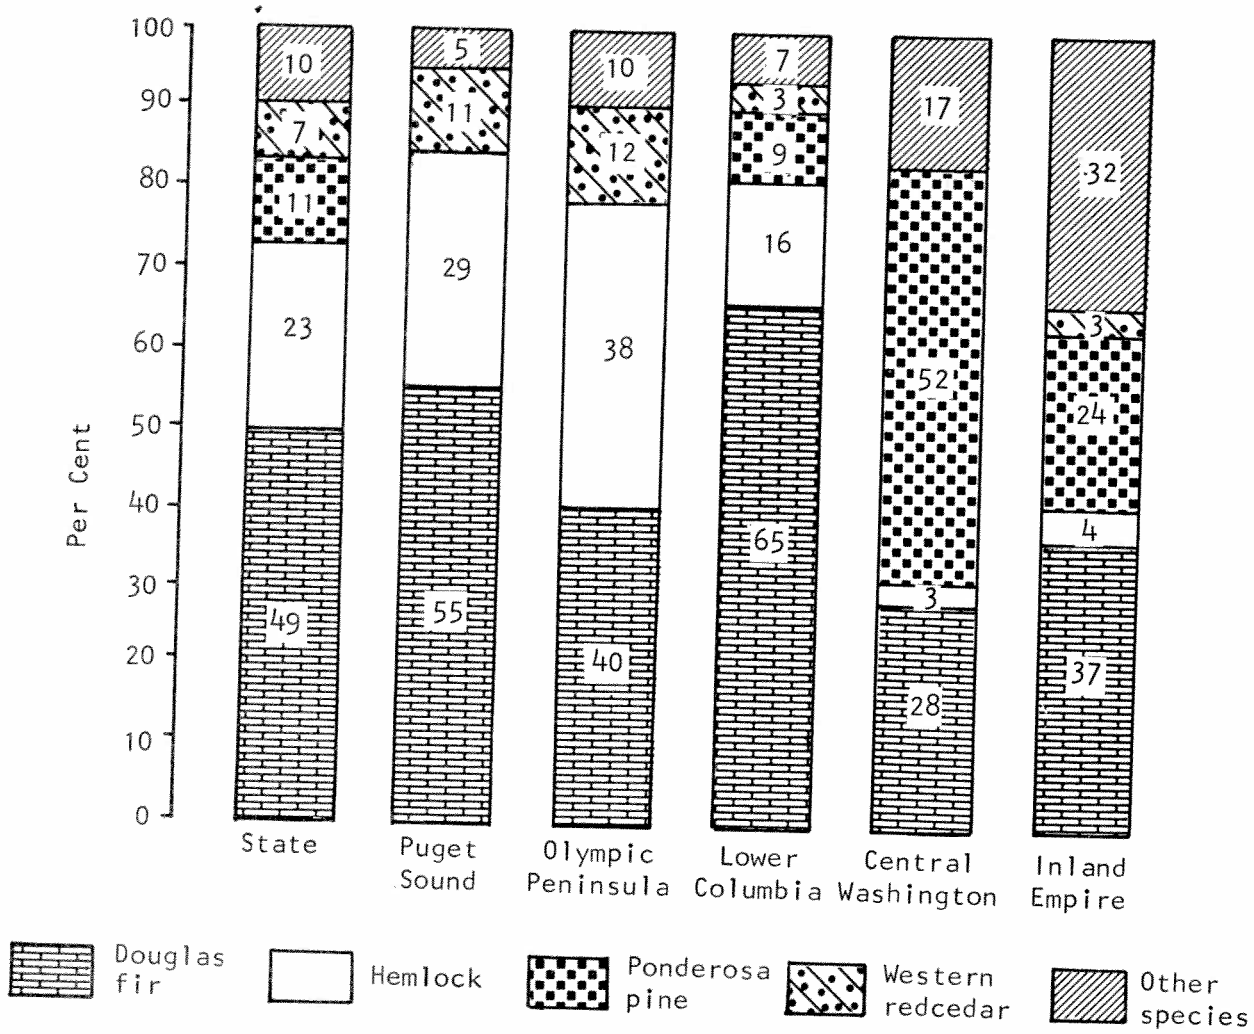
PRODUCTION

Lumber

Sawmills in the State of Washington produced 3,159,761,000 board feet of lumber during 1970. Under the operating conditions reported, the sawmill industry's production was 82 per cent of capacity. Size-class D mills, operating at 69 per cent of capacity, were the most noticeable departure on a mill-size-class basis. Central Washington mills, which operated at 90 per cent of capacity, were the most noticeable departure from the average on an area basis.

Economic Area	Lumber Production Per Cent
Puget Sound	35
Olympic Peninsula	22
Lower Columbia	21
Central Washington	13
Inland Empire	9
Total State	100

Figure 8.—Distribution of Sawmill Log Consumption by Species and Area.



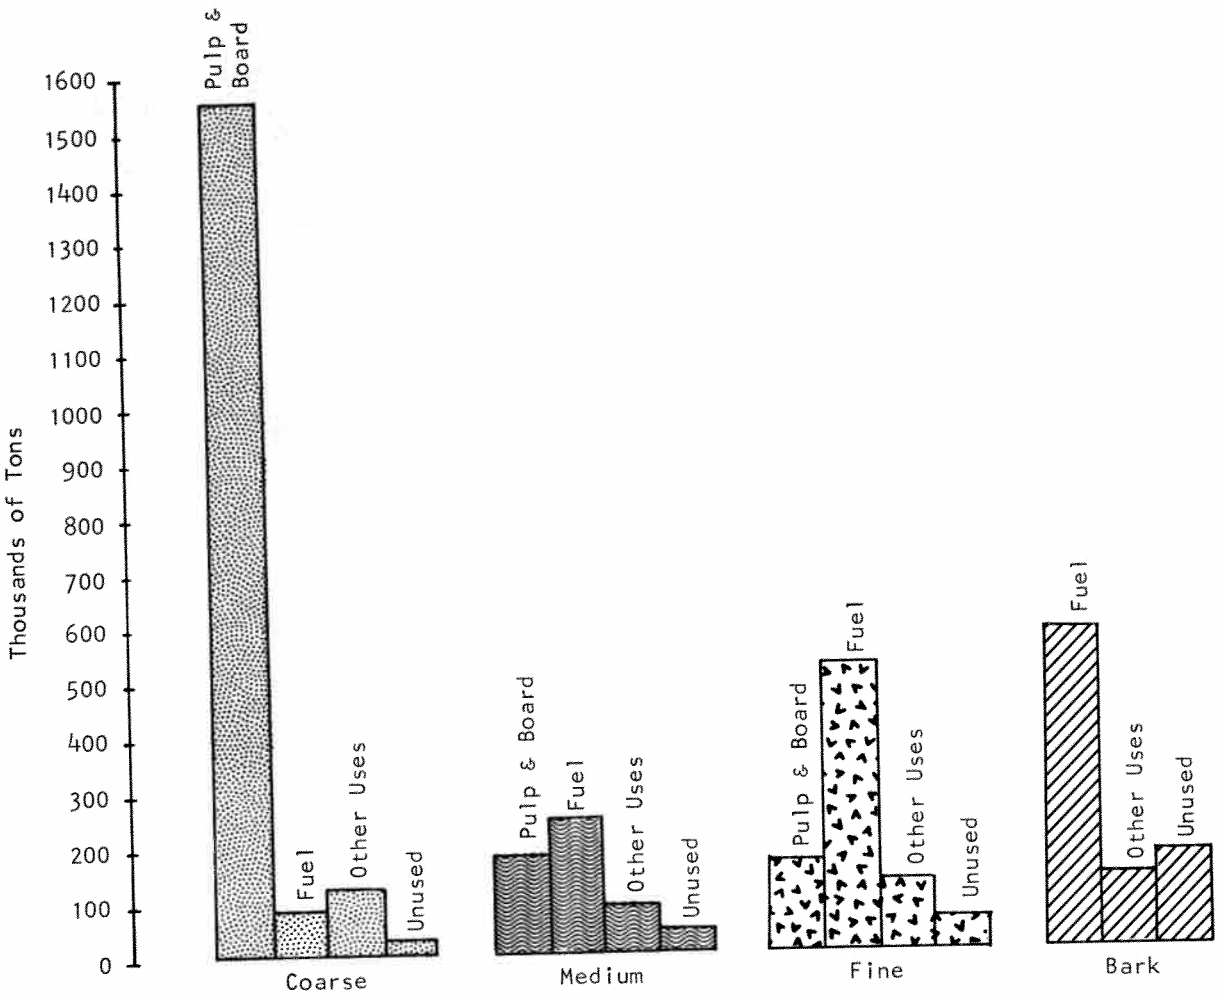
Residues

Production of 3.2 billion board feet of lumber resulted in 4.1 million tons of residue (Table 26) classified as coarse (slabs, edgings, trim, spur ends), medium (shavings), fine (sawdust), and bark. Wood residues (excludes bark) made up 3.2 million tons of the total—approximately one ton for every 1,000 board feet produced.

Uses of residues include: raw material for the Pulp and Board Industry, fuel for industry and the community, animal bedding, garden landscaping and mulch. These and other uses consumed 92 per cent of all residues produced by sawmills. Figure 9 illustrates the uses of each type of residue.

Unused residues were generally burned (but not as a source of fuel), left in the woods (by portable mills), or dumped near the mill site.

Figure 9.—Type and Disposition of Sawmill Residues



Mill Size-Class	Pulp & Board	Fuel	Other Uses	Unused
		Wood Residue Use		
	- - - - - -	per cent	- - - - - -	
A	60	30	9	1
B	59	24	15	2
C	60	22	8	10
D	42	14	21	23
All Mills	59	27	10	4
		Bark Residue Use

B	..	37	21	42
C	..	39	22	39
D	..	17	35	48
All Mills	..	65	16	19

COMPARISON TO 1968 DATA

Table 9 of the 1968 report gave the unit of reference for shift capacity as *million board feet;* it should have been *thousand board feet.* The text portion identified shift capacity as *billion board feet* and should have been *million board feet.*

VENEER AND PLYWOOD INDUSTRY

MILL CHARACTERISTICS

Facilities

The 41 softwood veneer and plywood mills were located in each of the State's economic areas and in 19 of the 39 counties (Table 34). Lewis County, with the greatest number of mills (6), contributed to making Olympic Peninsula the leading area in the State (18 mills).

Production Capacity

Table 35 shows the production capacity per shift for each type of mill by county.

Economic Area	Average Shift Capacity per Mill* MSF 3/8" Basis
Lower Columbia	146
Puget Sound	131
Inland Empire	113
Olympic Peninsula	110
Central Washington	108
Total State	123

**Includes Veneer and layup, Veneer only, Layup only*

Most mills in the Olympic Peninsula Area were veneer-only plants. On a statewide basis, these plants had a lesser average-shift capacity than those having veneer and layup facilities.

Mill Type	Average Shift Capacity MSF 3/8" Basis	Number of Mills
Veneer & layup	137	21
Veneer only	112	14
Layup only	96	6
All types	123	41

Equipment

Tables 36 and 37 present statistics on log utilization with respect to lathe diameter limits and size of cores produced. Many mills could handle logs at least five feet in diameter and reduce them to eight-inch (or smaller) diameter cores. Core material was also utilized for posts, for sawing into lumber, and as a source of chips for the Pulp and Board Industry. Another example of utilization shows that 80 per cent of the mills used veneer chippers during 1970, while only 29 per cent used burners (Table 38).

Age and Ownership

More than half the mills (26) had been in their present location for more than 10 years; 18 of those more than 20 years (Table 39).

In the past five years, seven new mills have been built, four of which are in Eastern Washington. The only other Eastern Washington mill is less than 10 years old, an indication that the industry is relatively new in that part of the State.

Operating Days

Operation during 1970 averaged 224 days for all types of mills. Averages for each type of mill by area are shown in Table 40.

WOOD CONSUMPTION

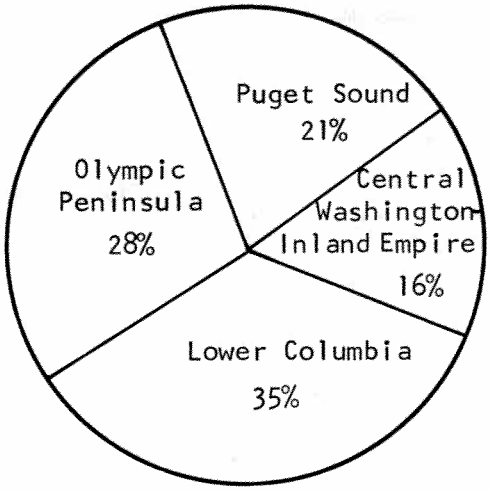
Raw Material

The veneer and plywod industry consumed 688 million board feet of logs during 1970. Nearly all (97 per cent) of this volume consisted of sound live logs (Table 41). Area variation ranged from 93 per cent in the Puget Sound Area to 100 per cent in the Central Washington-Inland Empire Areas. Utility grade (cull) logs accounted for 2 per cent of the total; the remaining 1 per cent, sound dead material.

Age

Old growth timber (more than 100 years old) made up 74 percent of the logs used, with the per cent of use varying considerably among economic areas (Table 42). Greatest use of old growth occurred in the Lower Columbia Area (90 per cent) and the least in the Central Washington-Inland Empire Areas (17 per cent). Total log consumption is shown in Figure 10.

Figure 10.—Veneer and Plywood Log Consumption by Economic Area



Inventories

Log receipts for the industry can be estimated from the mills' inventory changes and consumption during the year. Net inventory changes were generally negative except in the Lower Columbia Area where the net change showed a slight gain (Table 43). From this data, the apparent receipts for 1970 amounted to 663 million board feet. Inventory depletions were a small percentage of the total consumption.

Economic Area	Net Change in Inventory (Per Cent of Total Consumption)
Puget Sound	−8.8%
Olympic Peninsula	−4.3%
Lower Columbia	+0.3%
Central Washington-Inland Empire*	−3.8%
Total State	−3.6%

**Combined to avoid disclosure*

Ownership

Public lands, an important source of logs for the industry, provided over half the logs consumed in the economic areas and 58 per cent of the total industry requirement (Table 44). National Forest lands were the greatest single source of logs.

Economic Area	Source of Logs: National Forest Lands	Source of Logs: Forest Industry Own Wood Supply
	per cent	
Puget Sound	44	43
Olympic Peninsula	62	8
Lower Columbia	30	52
Central Wash.-Inland Empire*	29	23
Total State	42	33

**Combined to avoid disclosure*

Forest Industry's own lands contributed the major portion of wood consumed from private timberlands.

Although these two sources provided the majority of the logs, many other ownerships contributed to the total.

Ownership		Per Cent of Logs Supplied
State		10
National Forest		42
Bureau of Land Management		1
Other Public		5
Total Public		58
Forest Industry	Own Wood Supply	33
	Other Wood Supply	3
Farmer & Misc. Private		6
Total Private		42
All Owners		100

Table 45 shows the dependency of individual mills on each ownership. It indicates that 13 mills were at least two-thirds dependent on public timber; five mills were similarly dependent on private timber.

Species

With 70 per cent of the total, Douglas fir was the leading species used by the industry (Table 46). Second in importance was hemlock, 15 per cent. The Puget

Sound Area showed the most deviation—51 per cent Douglas fir and 43 per cent hemlock. Nearly all cull material was from those two species (Table 47).

Imports

Two areas acquired logs from outside the State. A small amount from British Columbia went to the Puget Sound Area, and a little less than 10 per cent of the Lower Columbia Area's consumption came from Oregon (Table 3). State-wide log imports were three per cent of the total log consumption.

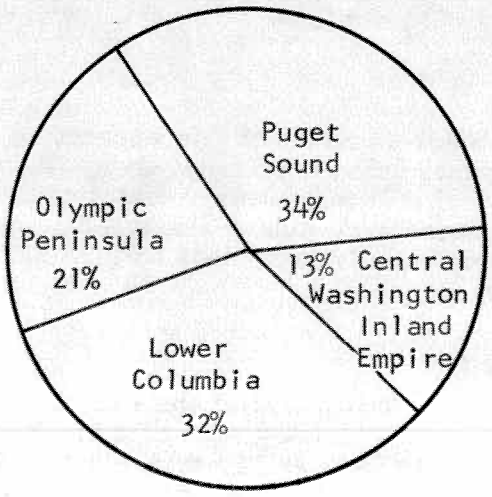
In addition to logs, the veneer and plywood industry used 195,340,000 square feet of 3/8 inch basis veneer in excess of the amount produced during 1970. Converted to Scribner log scale, this is equivalent to about 85 million board feet or about 12 per cent of the industry's total wood consumption.

PRODUCTION

Plywood and Veneer

During 1970, the industry produced 1,804,905,000 square feet (3/8 inch basis) of plywood. This was 12½ per cent of the national total, making Washington the second largest plywood supplier.

Figure 11.—Plywood Production by Economic Area



Under the operating conditions reported by the mills (shift capacity, shifts per day, the days of operation) plywood production was 81 per cent of capacity. Veneer-only plants produced 436,332,000 square feet, 3/8 inch basis veneer, or 86 per cent of capacity.

Residues

One million tons of residue resulted from the manufacture of veneer and plywood (Table 48). Residue utilization is important to the industry and the environment; 95 per cent of all residues were reported to have been used. Unused material comprises volumes which were burned solely for waste disposal or hazard reduction and volume which was not used for any purpose.

Wood residues accounted for 77 per cent of all residues. Four classifications of wood residue were identified: cores, coarse (log trim, roundup and veneer clip, spur trim), medium (panel trim, reject veneer), and fine (sander dust). More than 99 per cent was used—an extremely high utilization.

Wood Residue Use

Residue Type	Pulp & Board	Fuel	Other Uses	Unused
	per cent			
Coarse	86	12	2	†
Cores	47	1	52	†
Medium	1	92	1	6
Fine	..	96	4	†
All wood	57	32	9	2

† *less than 0.5 per cent*

Bark made up the remaining 23 per cent of all residues. Research has been conducted for many years on new uses for bark residues, but without much impact on its use as a fuel.

Bark Residue Use

Use	Per Cent
Fuel	75
Other Uses	7
Unused	18
All bark	100

Production and disposition of residues by economic area are presented in Tables 49 and 50.

COMPARISON TO 1968 DATA

Because layup-only plants have no log consumption, they appeared in various 1968 tables as a counting mechanism only. Comparisons for this type of data involve Veneer & layup and Veneer-only plants.

In Table 34 of the 1968 report, the 10-19 lathe log diameter limit should have been labeled *layup only*. Table 35 of the 1968 report included the 5 layup-only facilities in the *3-inch diameter of cores produced* column.

A coding error was discovered in Table 32 of the 1968 report. The Veneer & Layup capacity for Lewis County was shown as *2,000;* it should have been *200* with similar adjustments in subtotals and State total.

PULP AND BOARD INDUSTRY

MILL CHARACTERISTICS

Facilities

Thirty-one mills, concentrated in 20 communities and owned by 13 separate firms, produced various types of pulp and board. Table 51 shows the geographic distribution of four types of pulp mill and two types of board mill. In number of mills, Puget Sound was the leading area (10 mills); the leading county was Cowlitz (7 mills) in the Lower Columbia Area.

Production Capacity

Two-thirds of all mills are either sulfite or sulfate. They accounted for 83 per cent of the industry's daily production capacity, 11,536 tons (Table 52). Lower Columbia was the major area and Cowlitz the leading county.

Age and Ownership

All mills have occupied their present site for at least 11 years and most (24 mills) for more than 20 years. As shown in Table 53, ownership has been quite stable since only 4 of the 31 mills have changed owners since 1960.

Operating Days

In all economic areas, pulp mills showed greater employment stability than board mills during 1970.

Economic Area	Average Number of Operating Days	
	Pulp	Board
Puget Sound	348	254
Olympic Peninsula	334	286
Lower Columbia	333	...
Inland Empire	341	...
Total State	339	270

WOOD CONSUMPTION

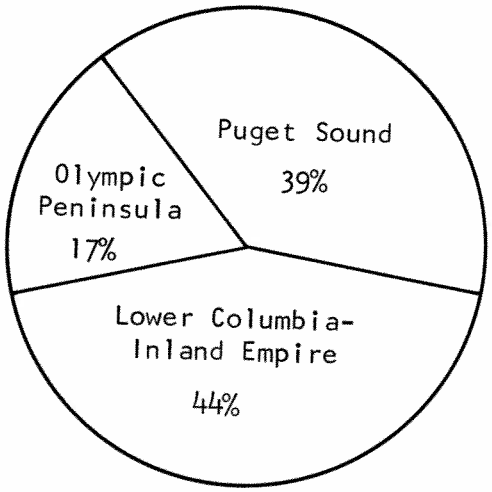
Raw Material

The industry consumed the equivalent of approximately 8.3 million bone dry tons of wood—1.8 billion board feet of roundwood and 4.7 million tons of chips, sawdust and shavings.

Economic Area	Chips From Mill Residue	Round-Wood
	per cent	
Puget Sound	44	48
Olympic Peninsula	16	70
Lower Columbia-Inland Empire*	63	29
Total State	46	44
Million Bone Dry Tons	3.8	3.6

**Combined to avoid disclosure*

Figure 12.—Pulp and Board Wood Consumption by Economic Area (Bone dry tons)



The Pulp and Board Industry is the biggest user of utility grade (cull) logs which supplied 19 per cent of the industry's 1970 roundwood consumption.

Age

Table 56 shows roundwood consumption by age class for each area. Most (77 per cent) of the roundwood came from old growth timber.

Ownership

Private timber holdings supplied 1.5 billion board feet, or 83 per cent of the roundwood (Table 57). No wood came from Bureau of Land Management lands.

Owner	Per Cent of Log Supply
State	8.3
National Forest	6.5
Other Public	2.0
Total Public	16.8
Forest Industry — Own Wood Supply	69.5
Forest Industry — Other Wood Supply	8.2
Farmer & Misc. Private	5.5
Total Private	83.2
All Owners	100

Ownership varied considerably according to area as shown in a different manner in Table 58. Only one mill was more than two-thirds dependent on public timberlands, while 14 mills were similarly dependent on private timberlands.

Species

Roundwood Species Consumed	Per Cent
Western hemlock	57
Douglas fir	23
Hardwoods	10
True firs	7
Western redcedar	2
Spruce	1
Total	100

In Table 59, the species composition of surrounding timberland reflects area differences. Of particular note is the greater reliance on hardwoods (15 per cent) in the Puget Sound Area and the increased use of Douglas fir (49 per cent) in the Lower Columbia-Inland Empire Area.

Utility grade (cull) volume, a significant portion of the total roundwood consumption, was largely hemlock. This species accounted for two-thirds of the industry's total volume.

Imports

Most of the roundwood came from timberlands within the State (Table 3). Imported logs made up 8 per cent of the roundwood consumption with Oregon as the principal source, followed by British Columbia and Idaho. Area diversity is shown by the Olympic Peninsula's use of 100 per cent Washington logs, while the Lower Columbia-Inland Empire Area used about 82 per cent.

Residues

The industry relied heavily on imported residues. About 41 per cent of the chips, sawdust and shavings originated outside the State (Table 60), with Oregon again the major source.

Residue Type	Origin			
	Wash.	Ore.	B.C.	Idaho
	- - - - - per cent - - - - -			
Chips				
Roundwood	61	..	27	12
Residue	59	26	6	9†
Sawdust & Shavings	56	34	9	1
All Types	59	24	8	9†

† *Contains 2 per cent from outside of Idaho*

COMPARISON TO 1968 DATA

All tables for the 1970 report are based on the total number of operations; each operation at a multiple plant facility is considered independently. In the 1968 report, certain tables concerning number of operations were based on a single count for multiple plant facilities.

LOG EXPORT INDUSTRY

INDUSTRY CHARACTERISTICS

The 55 log export (this survey) operations represent activities of 31 firms composed of members of the forest products industry, log export agents, and trading companies. Although trading companies ultimately handle nearly all export logs, this report considers only the volumes they originally obtained. Information concerning those volumes was supplied by log export agents and members of the forest products industry.

Logs were exported from 11 ports, all in Western Washington. The greatest number of operations occurred in the Olympic Peninsula Area (27) and in Grays Harbor County (12).

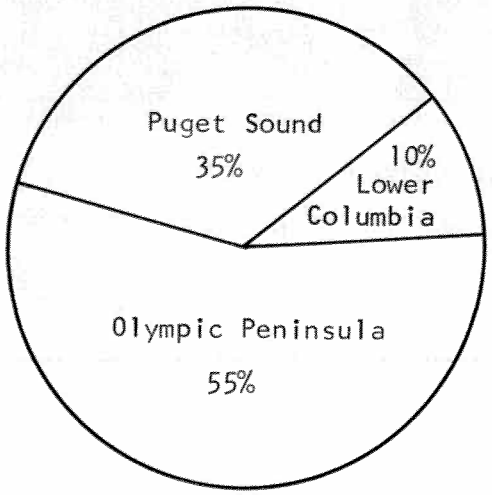
Facilities utilized by the industry are, essentially, the ports. Since ports handle a variety of material, average days of operation and production capacity of the Log Export Industry can not be meaningfully quantified.

About two-thirds (35) of the operations are at least five years old, and 6 have been in operation for more than 20 years. All export firms have tended to exhibit a very stable ownership pattern.

LOG CONSUMPTION

Export shipments totaled 1.7 billion board feet in 1970, making the export industry the third largest consumer of logs in the State. As shown in Figure 13, the Olympic Peninsula was the leading area. For purposes of this report, log consumption is equivalent to export shipments for the year 1970.

Figure 13.—Log Export by Economic Area



Slightly less than 97 per cent of the volume exported was sound live logs; 3 per cent was reported to be utility grade (cull) logs; and less than 1 per cent, sound dead. Over 71 per cent of the logs were from old growth timber.

Ownership		Per Cent of Log Supply
State		23
National Forest		9
Other Public		4
Total Public		36
Forest Industry	Own Wood Supply	41
	Other Wood Supply	12
Farmer & Misc. Private		11
Total Private		64
All Owners		100

Under the reporting conditions described earlier, 73 per cent of the operations were more than two-thirds dependent on a single ownership class for supplies—the highest dependency of any segment of the forest products industry. Sixteen operations were more than two-thirds dependent on their own lands and 9 were similarly dependent on State-owned timberlands.

Log export operations consumed more true fir and spruce than any other industry segment. They were second in consumption of hemlock and third in western redcedar. Hemlock contributed 55 per cent of their total log volume, with Douglas fir accounting for 22 per cent.

Washington's timberlands supplied practically all (99.6 per cent) of the logs exported from the State. Some logs originating in Oregon were exported from the Lower Columbia Area.

COMPARISON TO 1968 DATA

The larger number of operations in 1970 reflects a broader survey base and not necessarily a net increase in size of the industry.

THE SHAKE AND SHINGLE INDUSTRY

MILL CHARACTERISTICS

There were 172 shake, shingle, and hip & ridge mills in operation during 1970. The majority (99) of mills were located in the Olympic Peninsula Area, mainly in Grays Harbor County (55). Although this industry has the second largest number of mills, their combined shift capacity was 13,922 squares—equivalent to about 1,325,000 board feet Scribner (about one-eighth of the sawmill industry's capacity). The average mill size reflects the small investment needed to establish a shake or shingle mill or to reopen an inactive one.

More than two-thirds of the mills operated burners to dispose of waste residues. In contrast, 10 mills used chippers. Because of the volume of material handled, many mills have found it uneconomical to recover their residues.

The industry is characterized by a large number of transient mills having an average life span of only four years. Statistics presented in the tables are for the *operating* mills of 1970, only 80 per cent of which were in operation in 1968. One-third of the mills operating in 1970 had been in their present location and under their present ownership for more than 10 years.

Days of operation averaged 161, the effect of a depressed market.

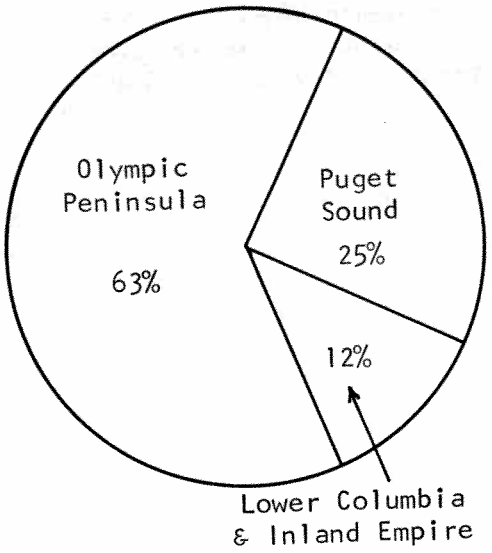
WOOD CONSUMPTION

Industry consumption during 1970 consisted of 188 million board feet of logs and the equivalent of 17 million board feet of blocks, boards, bolts, and other material.

Log volume was predominantly from sound live trees (75 per cent) and included a significant amount of sound dead timber (13 per cent). Utility grade (cull) logs accounted for 4 per cent, and other material for 8 per cent of the total log consumption.

Western redcedar is the only species in Washington State suitable for the manufacture of shakes and shingles. Products specifications further limit the consumption almost entirely to old growth. No other segment of the forest products industry must rely so heavily on a single species or age class.

Figure 14.—Shake and Shingle Wood Consumption by Economic Area



Considering this species dependency, it was not surprising that the industry obtained its wood supply from many ownership classes.

Ownership		Per Cent of Log Supply
State		11
National Forest		17
Bureau of Land Management		1
Other Public		15
Total Public		44
Forest Industry	Own Wood Supply	19
	Other Wood Supply	32
Farmer & Misc. Private		5
Total Private		56
All Owners		100

Individual mill dependency on an ownership class is also much greater. During 1970, 72 per cent of the mills obtained more than two-thirds of their wood supply from a single ownership class—61 mills from public sources, 62 from private sources.

Over 99 per cent of the industry's log consumption came from timberlands in Washington, with imports being limited to mills along the State boundary.

PRODUCTION AND RESIDUES

With total production amounting to 2,144,591 squares of shakes and shingles, the industry operated at 58 per cent of capacity (for 1970 conditions). This production created 188,559 bone dry tons of residue composed of 72 per cent wood (classified as 24 per cent coarse, 48 per cent fine) and 28 per cent bark. As mentioned earlier, recovery of residues is uneconomical for many mills and accounts for the high percentage of unused material.

Residue Type and Distribution

Use	Coarse	Fine	Bark
	- - - - - per cent - - - - -		
Pulp	19	11	..
Fuel	7	14	12
Other	13	17	21
Unused	61	58	67
All	100	100	100

Amount of residue used varied considerably among areas. The Lower Columbia-Inland Empire Area mills used 58 per cent of their residues. A pulp market for fine material was partly responsible for this greater utilization.

COMPARISON TO 1968 DATA

Data presented in the 1970 report is generally more specific as exemplified by the questionnaires shown in the appendices of the respective reports.

POLE, POST, AND PILING INDUSTRY

INDUSTRY CHARACTERISTICS

In terms of number of operations, the the Pole, Post, and Piling Industry is the smallest segment of the forest products industry. The 19 firms making up this segment had 25 separate operations, most of them located in Western Washington.

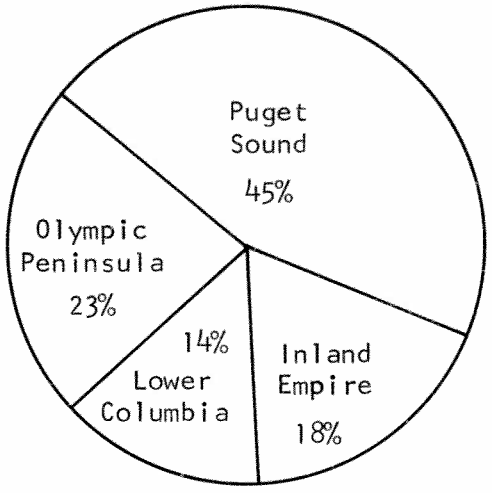
Yearly production capacity for 1970 was roughly 65 million board feet. However, the industry rarely uses the board-foot unit. Cubic feet, lineal feet, or pieces are the more common units of measure, but have been converted to board-foot units for comparison purposes.

Most of the operations had barkers which, considering the products, are almost essential. Many also had equipment for treating wood. The most common treatments were a solution of pentachlorophenol in either a heavy petroleum oil or a light petroleum solvent, creosote, and fire retardants. These facilities were also used for treatment of lumber, plywood, shakes and shingles produced by other segments of the forest products industry.

Variety in materials treated, a limited flexibility in the quality of roundwood used, and a constant demand for its products, have enabled the Pole, Post, and Piling Industry to achieve a high degree of stability. Only two operations have changed ownership since 1960; only three others, since 1950.

The industry averaged 229 days of operation during 1970, surpassed only by the pulp and board mills.

Figure 15.—Pole, Post and Piling Wood Consumption by Economic Area



Ownership		Per Cent of Log Supply
State		15
National Forest		13
Other Public		1
Total Public		29
Forest Industry	Own Wood Supply	5
	Other Wood Supply	42
Farmers & Misc. Private		24
Total Private		71
All Owners		100

Dependency by individual operations on a particular ownership class was the lowest of all segments of the forest products industry. Only 40 per cent obtained more than two-thirds of their logs from a single ownership class.

WOOD CONSUMPTION

Total wood consumption during 1970 was 61,984,000 board feet.

Log consumption was entirely composed of sound material—a quality requirement of the industry—with the majority (69 per cent) of logs coming from young timber.

Two species—Douglas fir and western redcedar—accounted for the bulk (98 per cent) of the log consumption. These two species possess the strength and durability needed for the industry's products.

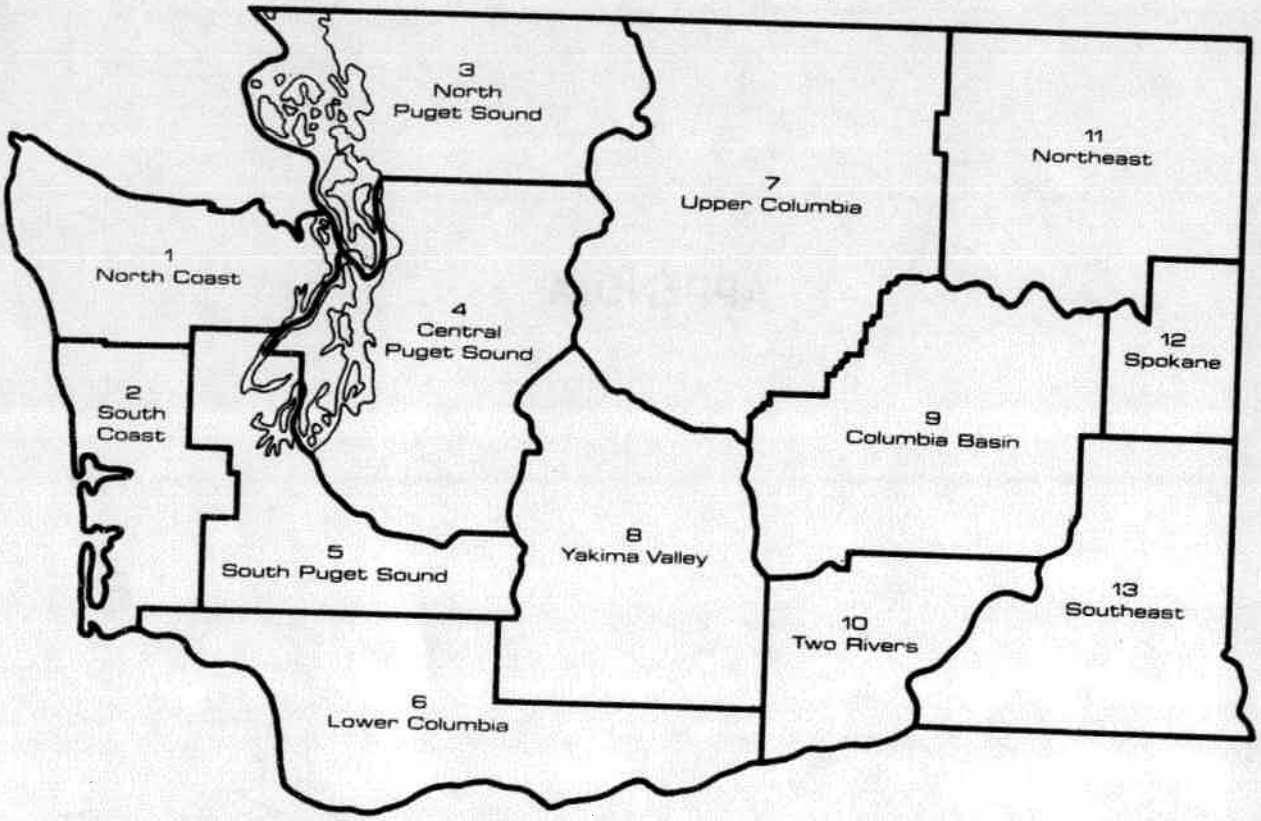
Washington's timberlands supplied 85 per cent of the industry's needs, with the majority of the imports coming from Idaho.

COMPARISON TO 1968 DATA

As with the Shake and Shingle Industry, data presented here is generally more specific than in the previous report.

APPENDIX

FIGURE 16
THIRTEEN ECONOMIC REGIONS



This map shows the thirteen economic regions defined by the Planning and Commerce departments of State government. The regions represent a management approach to the difficult task of integrated planning and industrial/economic development. As such, they are both a stimulator and a measuring device and, whether considered separately or in total, provide a graphic demonstration of Washington's diversity and aggregate strength. To preserve anonymity, we have combined statistics from these regions into five areas as illustrated in Figure 3, page 4.

LOG SCALES

Industries in the survey were requested to provide information on the type of scale they used for measuring logs. Results are summarized in Table 80. Some mills used more than one scale, depending on the type of material, which accounts for 547 responses from the 509 mills.

Scribner was the only board-foot scale reported. Variations in scaling standards (Forest Service, Log Scaling and Grading Bureaus, etc.) are not shown as separate entries in the table. It is apparent from the table that the Scribner long-log scale is favored in Western Washington and the short-log scale in Eastern Washington.

The lumber and veneer and plywood mills relied almost entirely on one or the other of the two Scribner scales. Pulp board mills used tons, cords, and cubic measure as well as board-foot scales. Although the "other industry" mills made extensive use of Scribner scale, they also reported a variety of other measurement units—cords, bolts, pieces, shake blocks, squares, lineal feet, etc.

All roundwood volumes not given in board feet were subsequently converted to Scribner scale which is used as a common denominator for this report.

Bolts, pieces, and shake blocks were generally converted to Scribner scale by the operator. Other measurements were converted as follows:

1 cord	=	500 board feet
1 ton	=	500 board feet
10.5 squares	=	1,000 board feet
1 lineal foot	=	3.8 board feet
1 cubic foot	=	6 board feet

MILL RESIDUES

Very few mills are able to quantify all the uses of residues. Generally, residue which is sold is measured; the higher the price, the more accurate the measurement. Chips used for pulp or board are commonly measured in terms of bone dry units (2,400 lbs.), 200 cubic foot units, or bone dry tons (2,000 lbs.). However, lower value products such as fuel or agricultural mulches are frequently sold by the truckload or cubic yard.

In this study, mills were asked to quantify use of residues when possible. Estimates of relative residue distribution were obtained from operators when quantities were unknown. In such instances, residue production ratios per unit of production from studies of sample mills were used. The residue estimates developed through use of these ratios were allocated on the basis of the estimated relative disposition made by the operator.

The residue factors used are as follows:

HARDWOOD SAWMILL RESIDUES[1]

Average residue developed from producing 1,000 board feet of lumber using a narrow kerf bandsaw.

	200 cu. ft. units	Dry tons
Chips	.97	.82
Bark	.40	.34
Sawdust	.27	.23

[1]*Based on informaton furnished by Northwest Hardwoods, Inc.*

SOFTWOOD SAWMILL RESIDUES[1]

Average quantity of residues developed from producing 1,000 board feet of lumber.

Item	Solid Volume*		Washington	
			Western	Eastern
	Cubic Feet	*Per Cent***	*Dry Weight Tons*	
Wood Residue				
Slabs, Edgings, Sawmill Trim	40	24.2	.512	.480
Planer Trim	3	1.8	.038	.036
Sawdust	22	13.4	.282	.264
Planer Shavings	16	9.7	.205	.192
Total Wood Residue	81	49.1	1.037	.972
Bark	19	11.5	.285	.228
Lumber	65	39.4	.832	.780
Whole Log	165	100.0	2.154	1.980

[1]*Based on data from Oregon mills compiled by Oregon State University, School of Forestry, in 1967. Dry weights adjusted for different species mix utilized in Washington.*
**Equivalent undried solid volume.*
***Per cent by volume.*

SOFTWOOD PLYWOOD RESIDUES[1]

Average quantity of residue developed in producing the equivalent of a thousand square feet of 3/8-inch plywood (rough basis) in 1962.

Plywood Residue	Solid Volume	Dry Weight	Proportion of Dry Weight
	*Cubic Feet**	*Tons*	*Per Cent*
Wood Residues			
Log Trim	3.4	.046	4.4
Cores	3.7	.050	4.7
Veneer Clippings, Roundup and Spur Trim	18.5	.250	23.8
Dry Trim and Layup Loss	6.5	.088	8.4
Sander Dust	1.6	.021	2.0
Total Wood Residue	33.7	.455	43.3
Bark	8.8	.132	12.6
All Residue	42.5	.587	55.9
Plywood	34.3	.463	44.1
Whole Log	76.8	1.050	100.0

[1]*Based on data from Oregon mills compiled in 1967 by Oregon State University School of Forestry. Because of the similarity of mills and species used, no adjustment was made in applying these data to Washington.*
**Volumes are based on equivalent green volume.*

SHINGLE MILL RESIDUES[1]

Average quantity of residue developed in utilizing 1,000 board feet of logs, Scribner scale, or in producing the equivalent volume of 10.5 squares.

Shake and Shingle Residue	Solid Volume		Dry Weight per MBM
	Cubic Feet	*Per Cent*	*Tons*
Shingles:			
Coarse	23	13.7	.22
Fine	78	46.8	.75
Bark	19	11.5	.28
Shakes:			
Coarse	23	13.7	.22
Fine	24	14.5	.23
Bark	19	11.5	.28
Shingle and Shake:			
Coarse	23	13.7	.22
Fine	51	30.6	.49
Bark	19	11.5	.28

[1]*From information provided by the Red Cedar Shingle Bureau.*

COMPUTER PROGRAMS USED FOR THIS REPORT

The Master file is built by a program written in PL/1 (Programming Language 1), a conventional programming language designed to fit the needs of both scientific and business applications.

SMART is the assembler language program written by Maurice F. Witney, Office of the State of Washington Superintendent of Public Instruction. This program was used for retrieval and processing of information contained in the majority of tables in this report.

SMART uses control cards which specify title, heading, data arrangement, and computational requirements necessary to produce the desired table. Information from the control cards is stored by *SMART* which then accesses the master file (card, tape, or disk) for data and produces the report.

The remaining tables were produced by a program called *Mark IV*. *Mark IV* is a file management program produced by Informatics Inc., Van Nuys, California. Tables and reports are produced by supplying parameter cards to the program. The parameter cards determine data selection, computations, report format, data sequence, titles, etc. which will be performed against the master file records to produce the desired report.
