Bidder's/Purchaser's Inspection of Sale Area and Forest Products

Acreage estimates and volume estimates contained within each timber notice of sale and each timber sale contract are made only for administrative and identification purposes. Except as expressly provided by the timber sale contract, the purchaser shall be responsible for paying the entire purchase price, even if the actual acreage or timber volume varies from the estimated quantity or volume shown.

All prospective bidders have the opportunity and are expected to inspect the sale area and the forest products located thereon. Bidders shall not rely on any representations by the State including, but not limited to, acreage estimates, volume estimates, appraisal or pre-bid documentation. The successful bidder/purchaser will further warrant that they have entered the timber sale contract without any reliance upon the DNR's volume estimates, acreage estimates, appraisals, pre-bid documentation, or any other representation by the DNR.

Any timber sale contract arising out of these public auctions will require the successful purchaser to warrant that they are entering the timber sale contract based solely upon their own judgment of the value of the forest products, formed after their own examination and inspection of both the timber sale area and the forest products being sold.

Exclusion and Disclaimer of Warranties

The PARTIES AGREE that the IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, and ALL OTHER WARRANTIES EXPRESS OR IMPLIED, ARE EXCLUDED from this transaction, and shall not apply to the goods sold. Schedule B
Sumas Pass PC Thinning Specifications

LEAVE TREE DEFINITION

Leave trees in all units will be selected by comparing their characteristics with other trees in the stand. Leave trees will be the best trees from the largest diameter classes available.

Preferred leave tree species in order of preference are:
1. Douglas fir
2. Western redcedar
3. Silver fir
4. Sitka spruce
5. Western hemlock

Best tree definition is having the following characteristics:
1. Fullest and most vigorous crowns.
2. Free of disease, major defect and damage.

Uniformly distributed means:
Openings created by felling trees shall not exceed 30 feet between leave trees. If openings in the stand approach this diameter, sufficient trees shall be left on the perimeter of the opening to maintain the appropriate trees per acre.

Deformed tree:
Any tree that has forked tops, broken tops, and severe cat faces (bark removed on more than half the circumference of the tree).

All Douglas fir greater than 15” diameter breast height (DBH) are to be left standing unless leaving them results in a residual stand of more than the indicated spacing or trees that are severely deformed as defined above.

FOREST PRODUCTS TO BE REMOVED

For Entire Sale Area:
Remove all hardwood stems.

Cut all trees 6” DBH and less. Trees less than or equal to 6” DBH will not count towards meeting required stand conditions.

5 of the trees from the largest diameter class designated for removal (described below) per acre of T-3 and T-4 RMZ must be directionally felled toward or into the stream and left. The number of trees will be determined by calculating the area of RMZ for each stream, ie; length of RMZ times the width (100’ for T-4 and 135’ for T-3). The trees to be felled toward/into the stream shall be chosen from within the sale area and within 25’ of the timber sale boundary tags adjacent to each stream.

Within Blue Special Management tags:

All trees not painted blue, unless approved in writing by the contract administrator for operational purposes only.

Within White Timber Sale Boundary tags (excluding the areas within Blue Special Management tags)

All stems resulting in a minimum of 175 square feet basal area and a maximum of 185 square feet basal area in the residual stand (within the diameter limit described under ‘LEAVE TREE DEFINITION’ thinning from below).
RESIDUAL STAND TARGET

The residual stand target is a minimum 175 square feet of basal area and a maximum of 185 square feet of basal area using a basal area factor 40 prism.

Additional information for estimation purposes only:

Unit #: 1
Trees per Acre: 111
Spacing: 20' x 20'
Relative Density (RD): 42

GENERAL REQUIREMENTS

Cable yarding corridors will be limited to 12-feet in width including rub trees. Corridors will be at least 150 feet apart when parallel as measured from the center of the corridors unless approved by the contract administrator. Landings will be located to provide for parallel yarding corridors wherever possible. When radial yarding corridors are required from a central landing, the distance between yarding corridors must be no closer than 150 feet where the corridor leaves the unit as measured from the center of the corridors. Where possible corridors should be located in a manner to minimize the damage to or removal of leave trees. When corridors are field located, only leave trees within 3 – 5 feet of the center of the corridor should be removed prior to yarding. Following completion of yarding of each corridor, damaged leave trees within 6 feet of the center of the corridor may be felled and yarded to the landing. It is not required to remove all leave trees from the 12-foot corridor.

COMPLIANCE

On the main body of the sale outside of the special management boundary tags, variable radius plots will be taken to determine basal area per acre for the unit. Plots will be evenly distributed at a density of at least 2 plots per five acres. Each plot will be measured with a 40 basal area factor (BAF) prism; the number of “in” trees multiplied by 40 will give the basal area for that plot. The average basal area of all plots in the unit will determine if the unit meets its target value. Borderline trees shall be measured at DBH to the face of the tree to the nearest 1/10th inch and multiplied by the plot radius factor of 1.903 to determine limiting distance.

Within the areas delineated with special management boundary tags no trees with silver tags or blue paint on them shall be cut.

Diameter limit compliance will be monitored using a stump diameter- breast height diameter regression equation.
